## Cloudera - Data Science Labs

### Introduction

Cloudera Data Science workbench is a new product from Cloudera launched in May 2017. It is based on the acquisition of Sense.io that we made in March 2016. Cloudera has taken this product enhanced it and ensures that all workloads can be pushed down to Cloudera.

Accelerate data science from exploration to production using R, Python, Spark and more

For data scientists

Open data science, your way.

Use R, Python, or Scala with your favorite libraries and frameworks

No need to sample.

Directly access data in secure Hadoop clusters through Apache Spark and Apache Impala

Reproducible, collaborative research.

Share insights with your whole team

For IT professionals

Bring analysis to the data.

Give your data science team the freedom to work how they want, when they want

Secure by default.

Stay compliant with out-of-the-box support for full Hadoop security

Flexible deployment.

Run on-premises or in the cloud

Cloudera Data Science workbench supports the R, Python, Scala programming languages. That capability could certainly be useful to Cloudera; the software could enable companies to make the most of their data scientists, who can then be more efficient with their use of company time and infrastructure.

Programming language and software environment for statistical computing and graphics.

Best known in: **Academia and statistics community.**

High-level programming language for general-purpose programming.

Best known in: **Machine learning and data engineering community.**

General-purpose functional programming language with a strong static type system.

Best known in: **Data engineering community, due to Spark.**

Cloudera's goal with Cloudera Data Science workbench is to Help more data scientists use the power of Hadoop, make it easy and secure to add new users, use cases.

### **Why Hadoop for Data Science well here are the reasons:**

High volume, low cost shared storage – More data more kinds of data  
Parallel compute local to the data – more experiments, better results  
Scalable, fault tolerant – easy to scale out, not just scale up  
Flexible multipurpose data platform – easier path to production  
Superior flexibility and price / performance to any other data platform

## Cloudera - Data Science Labs

### Lab 1 - Login to Cloudera Data Science Workbench (CDSW)

In this lab you'll learn how to:

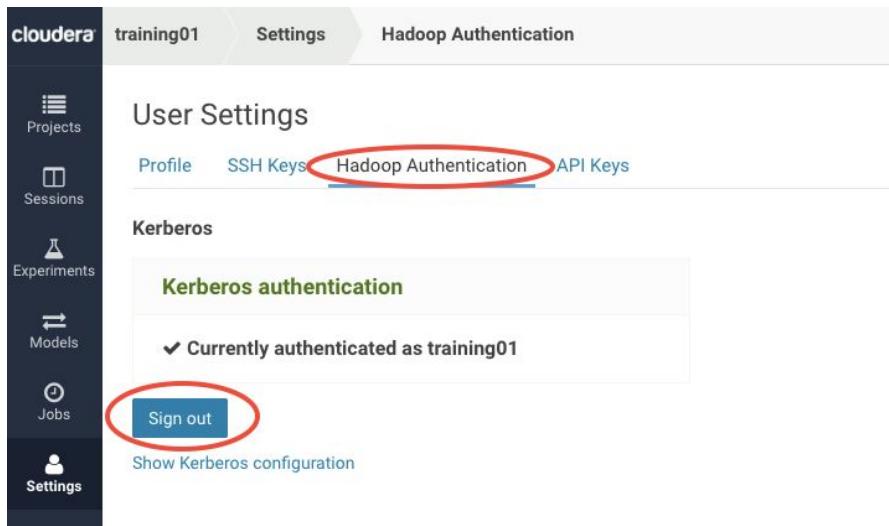

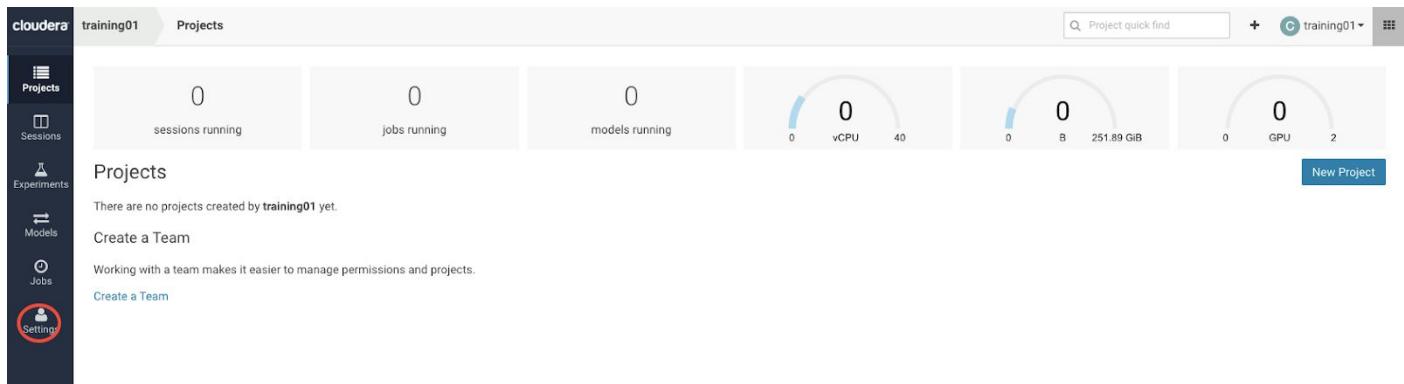

- Login to a Cloudera Data Science Workbench instance
- Set your Hadoop Authentication
- Navigate the Cloudera Data Science Workbench application

First thing you need to do is register onto Cloudera Data Science Workbench

URL: <https://cdsw.cloudera.tellarius.eu/>

Login with the provided credentials, like user trainingxx and a password.

When you are logged in, you need to specify the credentials to connect to the Cloudera cluster. Click on the 'Settings' button, and then the "Hadoop Authentication" link.

Since the password of your hadoop authentication most probably has changed, you need to hit the 'Sign out' button.

## Cloudera - Data Science Labs

Now, authenticate to the cluster using the same credentials that you used when you logged in into the Data Science Workbench.

### User Settings

Profile    SSH Keys    **Hadoop Authentication**    API Keys

#### Kerberos

To authenticate to Kerberos, enter your principal and either enter your password or upload a keytab file.

##### Principal

training01

##### Credentials

Password	Keytab
Enter Password	
*****	
<b>Authenticate</b>	

Show Kerberos configuration

If you authenticated successfully, navigate back to the project space by clicking on the ‘Projects’ button.

The screenshot shows the Cloudera Data Science Workbench interface. On the left is a sidebar with icons for Projects (circled in red), Sessions, Experiments, Models, Jobs, and Settings. The main area shows the 'User Settings' page under 'Hadoop Authentication'. It displays the message '✓ Currently authenticated as training01' and a 'Sign out' button. At the top, there's a navigation bar with tabs for Profile, SSH Keys, Hadoop Authentication (which is active), and API Keys. A 'Project quick find' search bar and a user dropdown for 'training01' are also visible.

## Cloudera - Data Science Labs

### Lab 2 - Creating a new project

You will see the project window as follows

The screenshot shows the Cloudera Data Science Labs interface. At the top, there's a header with the Cloudera logo, the user name 'jmuselaers', and a 'Projects' tab. Below the header are six performance metrics: sessions running (0), jobs running (0), models running (0), vCPU usage (0/40), memory usage (0/251.89 GB), and GPU usage (0/2). A 'New Project' button is located in the top right corner. On the left, a sidebar lists navigation options: Projects (selected), Sessions, Experiments, Models, Jobs, and Settings. The main area displays a list of projects: 'CDSW New project' (last worked on just now), 'Nproject' (last worked on yesterday), 'SEB' (last worked on yesterday), and 'Project C (can be deleted)' (last worked on 2 weeks ago).

You have on the left hand panel

**Projects** - where you create data science projects

**Jobs** - Run and schedule jobs and add dependencies

**Sessions** - Python, Scala or R sessions

**Experiments** - batch experiments

**Models** - build, deploy, and manage models as REST APIs to serve predictions

**Settings** - User, Hadoop Authentication, SSH Keys and permission settings

In the top right hand corner you have

**Search bar** - for search for projects

+ adding new projects or new teams

**User name** - Account settings and Sign out - Same as settings in home screen

Let's create a new Project

New Project

Copy and paste this GitHub URL into the Git tab

[https://github.com/jmuselaers/workshop\\_tellarius.git](https://github.com/jmuselaers/workshop_tellarius.git)

Project\_name = your user name and labs

You should see this

## Create a New Project

### Account

jmuselaers

### Project Name

CDSW New project

### Project Visibility

- Private** - Only added collaborators can view the project.
- Public** - All authenticated users can view this project.

### Initial Setup

Blank

Template

Local

Git

[https://github.com/jmuselaers/workshop\\_tellarius](https://github.com/jmuselaers/workshop_tellarius)

**Create Project**

## Cloudera - Data Science Labs

The screenshot shows the Cloudera Data Science Labs interface. On the left, there is a dark sidebar with various menu items: Account, Overview, Sessions, Experiments, Models, Jobs, Files, Team, and Settings. The 'Overview' item is currently selected. The main content area has a breadcrumb navigation bar: Account > test > CDSW Demo Test. The title 'CDSW Demo Test' is displayed with a lock icon. Below the title, there are sections for 'Models' (indicating no models yet), 'Jobs' (indicating no jobs yet), and 'Files'. The 'Files' section lists several Python and R scripts, along with a README file and configuration files.

Name	Permission
Filippo (flambiente)	Admin
Sofie (Gundersen)	
Sofia Thorén (sofiathoren)	

On the left hand side panel you will see a new menu items, among them Team where you can add team members to your project. Ask your neighbor for his or her username, and start typing in the search box.

As an example

fi	Add
Filippo (flambiente)	
Sofie (Gundersen)	
Sofia Thorén (sofiathoren)	

You can add anybody to your project. If you cannot find your neighbor, you can use the 'admin' user to share your project with.

## Cloudera - Data Science Labs

### Collaborators

This project is **private**. Only collaborators can view and edit this project. [Change Settings](#).

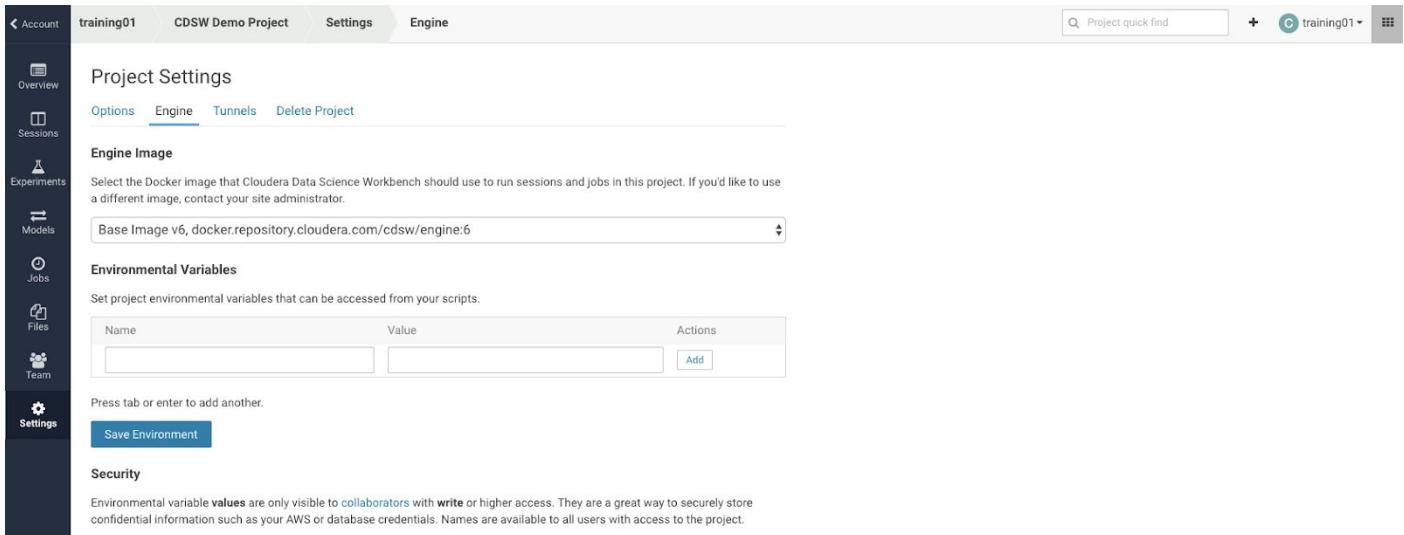

#### Add Collaborator

Collaborator	Permission	Actions
 amolenaar	Admin	<input type="button" value="change"/> <input type="button" value="delete"/>
 admin	Viewer	<input type="button" value="change"/> <input type="button" value="delete"/>

Granting write or admin permission to other users may have security impact since it gives them full access to your project files and running sessions. Write or admin permission should only be granted to trusted users.

Click on the Settings icon and then the Engine tab:

Project Settings

Options Engine Tunnels Delete Project

Engine Image

Select the Docker image that Cloudera Data Science Workbench should use to run sessions and jobs in this project. If you'd like to use a different image, contact your site administrator.

Base Image v6, docker.repository.cloudera.com/cdsw/engine:6

Environmental Variables

Set project environmental variables that can be accessed from your scripts.

Name	Value	Actions
<input type="text"/>	<input type="text"/>	<input type="button" value="Add"/>

Press tab or enter to add another.

Security

Environmental variable **values** are only visible to **collaborators** with **write** or higher access. They are a great way to securely store confidential information such as your AWS or database credentials. Names are available to all users with access to the project.

Under Project Settings you will see:

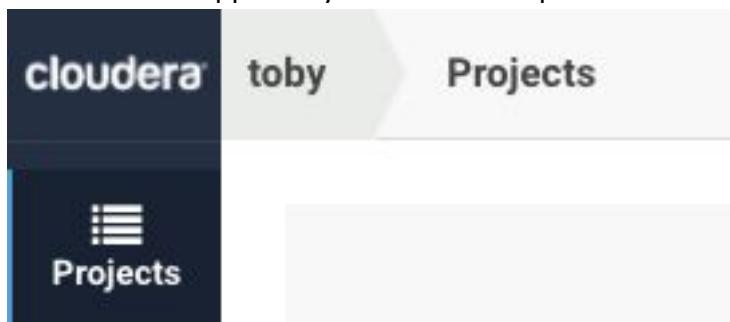

Options - Project Name and Description, Private or Public

Engine - Engine image and environment variables

Tunnels - SSH tunnels allow you to easily connect to firewalled resources such as databases or Hadoop

And this is where if you have to (please don't!) **Delete Project**

**Cloudera** - will appear if you are at the top level

< Account - will appear if you are at the project level

The screenshot shows the Cloudera Data Science Workbench interface. At the top, there's a navigation bar with tabs: Account (selected), Demo, Settings, and Engine. Below the navigation bar, the main title is "Project Settings". Underneath the title, there are several buttons: Options, Engine (which is underlined, indicating it's the active tab), Tunnels, Git, and Delete Project. On the left side, there's a sidebar with icons for Overview, Sessions, Experiments, Models, Jobs, Files, Team, and Settings. The "Overview" icon is highlighted with a blue box.

Click on the 'Overview' button.

Now, Launch a Python 3 Session as shown below:

The screenshot shows the Cloudera Data Science Workbench project overview page for "Andre\_CDSW\_Demos". The left sidebar includes links for Overview, Sessions, Experiments, Models, Jobs, Files, Team, and Settings. A message indicates that the license expires in 17 days. The main content area shows the project name and a "Fork" and "Open Workbench" button. Below this, sections for Models, Jobs, and Files are displayed. The "Files" section lists several Python and R scripts, along with their sizes and last modified times. A "Show Hidden Files" link is also present. At the bottom, there's a "Cloudera Data Science Workbench demos" section with a basic tour and a list of 4 provided scripts.

Name	Size	Last Modified
data	-	6 minutes ago
1_python.py	3.01 kB	6 minutes ago
2_pyspark.py	1.60 kB	6 minutes ago
3_tensorflow.py	3.39 kB	6 minutes ago
4_sparklyr.R	2.50 kB	6 minutes ago
5_shiny.R	769 B	6 minutes ago
README.md	1.74 kB	6 minutes ago
server.R	536 B	6 minutes ago
spark-defaults.conf	74 B	6 minutes ago
ui.R	689 B	6 minutes ago
utils.py	1.09 kB	6 minutes ago

## Cloudera - Data Science Labs

The screenshot shows the Cloudera Data Science Workbench interface. On the left, there is a file browser titled "Andre CDSW Labs" showing files like 1\_python.py, 2\_pyspark.py, 3\_tensorflow.py, 4\_sparklyr.R, 5\_shiny.R, README.md, server.R, spark-defaults.conf, ui.R, and utils.py. In the center, there is an editor window open on "README.md" containing Python code. On the right, there is a "Start New Session" tile with options for "Engine Image - Configure", "Select Engine Kernel" (Python 3 selected), "Select Engine Profile" (1 vCPU / 4 GiB Memory, 0 GPUs), and two buttons: "Launch Session" (circled in red) and "Run Experiment..".

1. On the far left is a file browser (note the little 'refresh' icon at the top: )
2. In the middle is an editor open on the file that you selected - in this case the README.md file.
3. On the right is a Session Start tile - in this case it's waiting for you to select an engine to run (so far your project has file space but no compute sessions).
4. Select the Python 3 kernel; select the 1 vCPU/4GiB Engine (and use this size engine for all your Python sessions in this workshop) and then the Launch Session button.

### Start New Session

#### Engine Image - Configure

Base Image v6 - docker.repository.cloudera.com/cdsw/engine:6

#### Select Engine Kernel

- Python 2
- Python 3
- Scala
- R

#### Select Engine Profile

1 vCPU / 4 GiB Memory ▾ 0 GPUs ▾

**Launch Session**

or **Run Experiment..**

5. This will startup a Python engine and the right hand side will become two tiles. The top one is an output tile and the bottom one (with a red, then green left hand border) is a shell input window.

## Cloudera - Data Science Labs

The screenshot shows the Cloudera Data Science Workbench interface. On the left, the file tree shows files like CDSW Demo Test, README.md, server.R, spark-defaults.conf, ui.R, and utils.py. The main area displays the contents of README.md. The terminal window on the right is titled 'Untitled Session' and shows a Python session with various commands and output related to setting up a Python 2 session, installing packages, and running R scripts.

```
File Edit View Navigate Run README.md Untitled Session By test - Python 2 Session - 1 vCPU / 2 GiB Memory - just now
Getting Started
This is your Python 2 session. Your editor is on the left and your input prompt is on the bottom.
To install a package type: pip install [package_name] at the input prompt.
To execute code from the editor, select the code and execute it with Command-Enter on Mac or Ctrl-Enter on Windows. You can also enter code at the prompt below.
Use ?command to get help on a particular command.

# Cloudera Data Science Workbench demos
Basic tour of Cloudera Data Science Workbench.

## Workbench
There are 4 scripts provided which walk through the interactive capabilities:
1. **Basic Python visualizations (Python 2).** Demonstrates:
    - Markdown via comments
    - Jupyter-compatible visualizations
    - Simple console sharing
2. **PySpark (Python 2).** Demonstrates:
    - Easy connectivity to (kerberized) Spark in YARN client mode.
    - Access to Hadoop HDFS CLI (e.g., `hdfs dfs -ls /`).
3. **TensorFlow (Python 2).** Demonstrates:
    - Ability to parallelize custom packages (e.g. `pip search tensorflow`).
4. **R on Spark via Sparklyr (R).** Demonstrates:
    - Use familiar dplyr with Spark using Sparklyr.
5. **Advanced visualization with Shiny (R).** Demonstrates:
    - Use of 'shiny' to provide interactive graphics inside CDSW.

## Jobs
We recommend setting up a **Nightly Analysis** job to illustrate how data is processed over time.

## Setup instructions
Note: You only need to do this once.

1. In a Python 2 Session:
    - Python
        - !pip2 install --upgrade dask
        - !pip2 install --upgrade keras
        - !pip2 install --upgrade matplotlib==2.0.0.
        - !pip2 install --upgrade pandas_highcharts
        - !pip2 install --upgrade protobuf
        - !pip2 install --upgrade tensorflow==1.3.0.
        - !pip2 install --upgrade seaborn
    Note, you must then stop the session and start a new Python session in order to use these packages.
2. In an R Session:
    - R
        - install.packages('sparklyr')
        - install.packages('plotly')
        - install.packages('nycflights13')
        - install.packages('Lahman')
        - install.packages('mgcv')
        - install.packages('shiny')
    ...
3. Stop all sessions, then proceed.

Line 1, Column 1 ★ 53 Lines Markdown Spaces 2
```

### 6. Look at the line 30 to 36 of README.md:

```
!pip2 install --upgrade dask
!pip2 install --upgrade keras
!pip2 install --upgrade matplotlib==2.0.0.
!pip2 install --upgrade pandas_highcharts
!pip2 install --upgrade protobuf
!pip2 install --upgrade tensorflow==1.3.0.
!pip2 install --upgrade seaborn
```

7. Question: What does this do? If you know Python it should be obvious; if you don't, then let me tell you: this is an execution of pip (a Python package manager), which will tell the system to install or upgrade the listed python packages
8. Make a block selection of these lines, and select 'Run Line(s)':

## Cloudera - Data Science Labs

```
28 1. In a Python 2 Session:  
29   ```Python  
30 !pip2 install --upgrade dask  
31 !pip2 install --upgrade keras  
32 !pip2 install --upgrade matplotlib==2.0.0.  
33 !pip2 install --upgrade pandas_highcharts  
34 !pip2 install --upgrade protobuf  
35 !pip2 install --upgrade tensorflow==1.3.0.  
36 !pip2 install --upgrade seaborn  
37  
38 Note, you must then stop the session and start
```

Run Line(s)

⌘Enter

Select All

⌘A

```
40 2. In an R Session:  
41   ```R
```

9. The cursor on the left should turn to red and, after a few seconds, you should see output like this:

The screenshot shows a terminal window with a dark theme. On the left, there's a file browser pane showing files like README.md, server.R, and util.R. The main terminal area has two sections: code input and output. The input section contains a Python script with various imports and data visualization examples. The output section shows the execution of the script, including pip upgrades and the resulting output of the code.

```
File Edit View Navigate Run README.md  
1.python.py  
2.pyspark.py  
3.tensorflow.py  
4.sparklyr.R  
5.shiny.R  
data README.md  
server.R  
spark-defaults.conf  
ui.R  
utils.py  
1 # Cloudera Data Science Workbench demos

10. What's happening here is that the code in the file is being executed in the console (did you notice the left hand edge turned red?) and now you can see the output in the right hand screen.

11. Stop this session. The Stop button is either on the top menu bar (when there's sufficient room for it):

← Project → Terminal access ⚡ Clear ⚡ Interrupt ■ Stop Sessions ▾

12. Or it's in the the Session drop down (when there's little room for buttons):

## Cloudera - Data Science Labs

ter on Mac or **Ctrl-Enter** on Windows. You can also

13. Now launch an R session. **Use a 1vCPU, 4GiB Engine**. Use this size engine for **all** your R sessions during this workshop.

### Start New Session

#### Engine Image - Configure

Base Image v6 - docker.repository.cloudera.com/cdsw/engine:6

#### Select Engine Kernel

- Python 2
- Python 3
- Scala
- R

#### Select Engine Profile

1 vCPU / 4 GiB Memory ▾

0 GPUs ▾

**Launch Session**

or

**Run Experiment..**

14. This time we're going to execute lines 42 through 47 in the R session (these numbers could be off by 1 or so ... look at the images below and figure out what you need to select). Select and highlight just these lines then select Run Lines to execute as in prior step:

```
40 2. In an R Session:  
41   ``R  
42 install.packages('sparklyr')  
43 install.packages('plotly')  
44 install.packages("nycflights13")  
45 install.packages("Lahman")  
46 install.packages("mgcv")  
47 install.packages('shiny')
```

```
install.packages('sparklyr')  
install.packages('plotly')  
install.packages("nycflights13")  
install.packages("Lahman")  
install.packages("mgcv")  
install.packages('shiny')  
...  
...
```

Run Line(s)

⌘Enter

Select All

⌘A

This process will take 2 or 3 minutes because code is being downloaded, compiled and installed into your project's workbench.

Note that this workbench is independent of any other project's workbench. You want to try out different and conflicting libraries? Go for it. Just start another project, open the workbench, pick the libraries you want, install them and off you go. Just like on your laptop, but this is managed, secure, stable, won't get stolen from a taxi, is always available and easily shared!

All of this isolation is achieved by mounting filesystems (one or more per project) into docker containers (one per engine). The details don't matter, except to note that now you can really go mad and try out lots of different and conflicting permutations without having to go down the complex path of virtual environments etc. It's all been done for you!

### Lab 3 - Visualization and Sharing

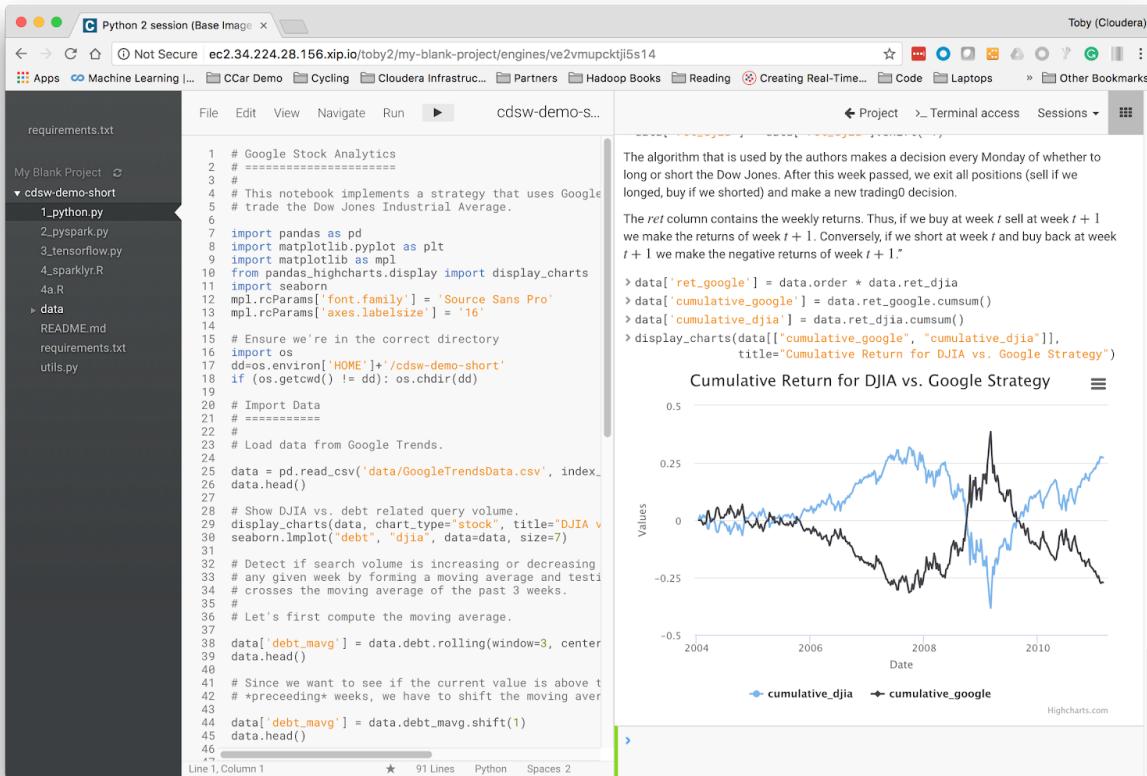

Check that you have NO sessions running - if any sessions are running then stop them now. You've setup your environment and those sessions can be safely disposed of.

Data Science is often about visualizing ideas, and then sharing them to persuade others to take action. CDSW lets you use the visualization tools you'd use naturally, and adds a neat twist to the whole idea of sharing. Let's get started:

1. Start up a new Python 3 session (1vCPU, 4GiB) in the same manner you did before.
2. Select 1\_python.py in the file browser
3. Run the entire file (multiple ways of doing that - try to figure out more than one way. It should be pretty obvious!).

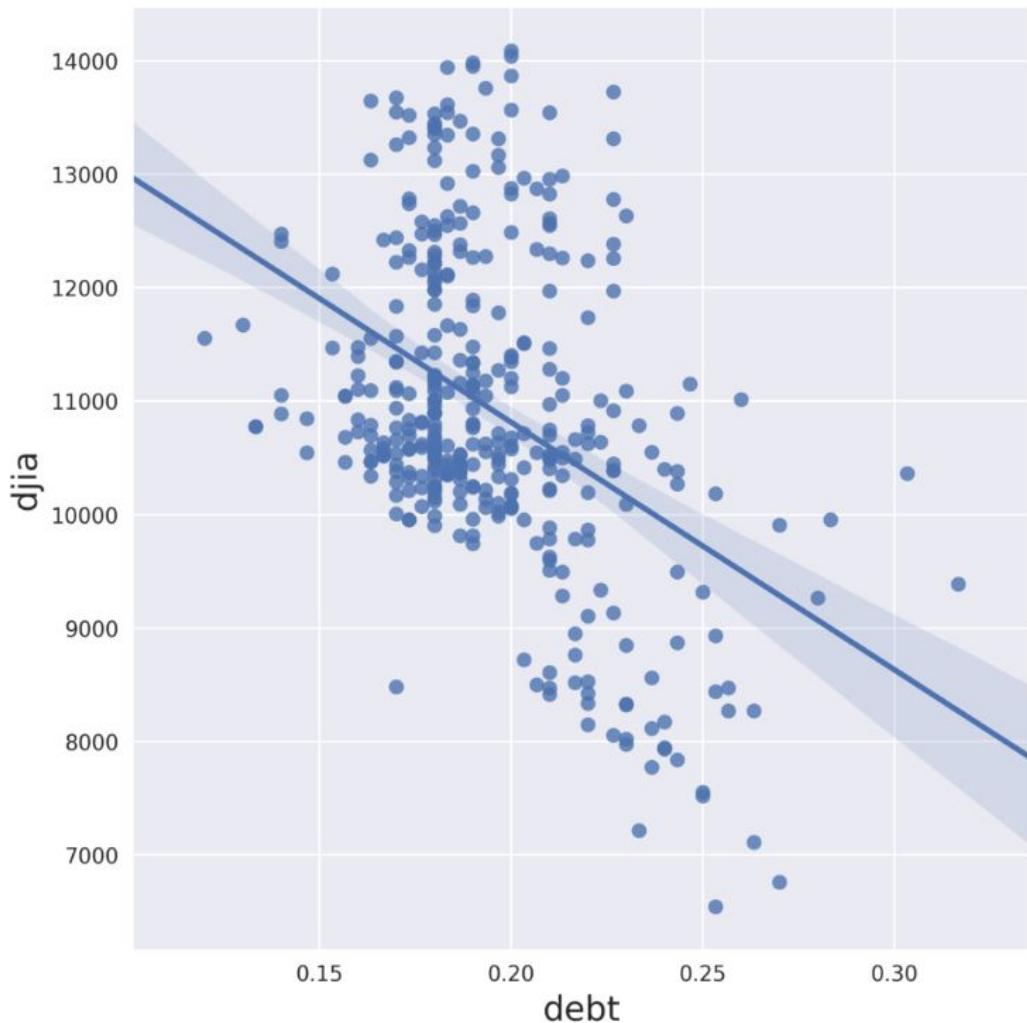

4. You should end up with some nice graphs in the output window:

5. You can see that CDSW is very similar to a notebook, supporting the same visualization tools. However, unlike a notebook, it doesn't use cells: instead it uses markup in the source file, and an output window. Furthermore, that window has some interesting properties ...

6. Scroll up to find this diagram:

7. On the left is a little chain link button:

8. Click on it and you'll see beneath the chart some html that can be used to embed that chart into a web site:

Copy and paste to embed this cell in your website!

width (optional)

height (optional)

```
<div id='sense-widget-s7dkodjq' class="sense-embed-container" style="width:100%;"><script id='embedding-script-21' src='http://consoles.cds.52.214.150.212.nip.io/js/sense-embed.js' data-cell-url='http://livelog.cds.52.214.150.212.nip.io/topics/xeupfj2oeyaktdpa_output/21' data-auth-token='eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9.eyJhdXR0Ijp7InJ1YWQiOlsieGV1cGZqMm9leWFrdGRwYV8qIl0sIndyaXR1Ijpb data-assets-cdn-root='http://consoles.cds.52.214.150.212.nip.io/0/7/xeupfj2oeyaktdpa/' data-widget='sense-widget-s7dkodjq' data-width="" data-height=""></script></div>
```

9. Scroll to the top of the window and you'll see this on the far right (the exact layout depends upon the real estate available – you might have to expand your browser window to see the following links and they might be laid out vertically or horizontally):

10. Hit the 'collapse' link and see the difference in the output window.  
11. Question: What difference did you see? How might this be used? Is it useful?  
12. Notebooks have great output, but how do you share what they show you? CDSW solves this by simply providing a link to the output that you can send to anyone and they can see the output. Try it:  
13. Select the 'Share' link:

A screenshot of a 'Share with Others' dialog box. It contains a message: 'These results are private. Only project members can view.' Below this is a large blue button labeled 'Share with Others'.

14. And then 'Share with Others' (your URL will be similar, but different from this one):

A screenshot of a sharing configuration dialog box. It shows a URL input field containing 'http://cdsw.34.254.254.246.r' and a 'Stop Sharing' button. Below the URL is a checked checkbox for 'Hide code and text'. Under 'Who can view:', there is a radio button selected for 'Anonymous visitors with the link'. Other options include 'Any logged in user with the link' and 'Specific users/teams with the link (Change...)'. A note at the bottom says 'Currently shared with no one.'

15. Cut and paste that link and put it into some other browser (best to be a completely different browser than the one you're logged in with, but not that important)  
16. You should see that you have access to almost the same output window (this new one doesn't have this share link!)

The screenshot shows a browser window with the URL `cdsw.52.214.150.212.nip.io`. The page title is "Python 2 session (Base Image v2), 1 vCPU / 2 GiB Memory, on 9/6 at 9:26". A "Running" status indicator is visible. The main content area is titled "Google Stock Analytics" and discusses a strategy using Google Trends data to trade the Dow Jones Industrial Average.

### Google Stock Analytics

This notebook implements a strategy that uses Google Trends data to trade the Dow Jones Industrial Average.

Ensure we're in the correct directory

### Import Data

Load data from Google Trends.

	djia	debt
Date		
2004-01-14	10485.18	0.210000
2004-01-22	10528.66	0.210000
2004-01-28	10702.51	0.210000
2004-02-04	10499.18	0.213333
2004-02-11	10579.03	0.200000

Show DJIA vs. debt related query volume.

So we've demonstrated how CDSW is like a notebook, but is perhaps more powerful, and has great sharing capability. Let's go on to see about integration with Hadoop!

### Lab 4 - Hadoop Integration

In this lesson we'll see two mechanisms for integrating with Hadoop:

1. Filesystem - storing data in Hadoop itself using HDFS
2. Computation - executing code on the Hadoop cluster via Spark

Execute the following instructions.

1. Clean up your Python session by hitting the 'clear' button and the 'expand' link (if available)

2. Select the 2\_pyspark.py file
3. If you don't have a Python 3 workbench session open yet, Launch a Python 3 session 1 vCPU / 4 GB RAM
4. Run line 32:  
`!hdfs dfs -put -f $HOME/data/kmeans_data.txt /user/$HADOOP_USER_NAME`
6. Execute the 2\_pyspark.py file in your already running Python session
7. **Question:** What did it do?
8. **Question:** What kind of thing is the variable 'data'? (try typing 'data' into the console and seeing what gets printed out.)
9. Open a terminal using the 'terminal' icon in the top right:

10. Execute 'hdfs dfs -ls' to see the data file in the hadoop file system (or, to show off, execute '! hdfs dfs -ls' in the python console to do the same thing!)

## Cloudera - Data Science Labs

```
Welcome to Cloudera Data Science Workbench

Kernel: python2

Project workspace: /home/cdsd

No Kerberos principal or Hadoop username detected

Runtimes:
  R: R version 3.4.1 (--) -- "Single Candle"
  Python 2: Python 2.7.11
  Python 3: Python 3.6.1
  Java: java version "1.8.0_121"

Git origin: https://github.com/andremolenaar/CDSW-Demo-Short

cdsw@6mzzmuu4vvgsbjy:~$ hdfs dfs -ls
Found 5 items
drwx-----  - cdsw cdsw          0 2018-10-05 13:00 .Trash
drwxr-xr-x  - cdsw cdsw          0 2018-10-12 11:23 .sparkStaging
-rw-r--r--  3 cdsw cdsw         71 2018-10-12 11:22 kmeans_data.txt
drwxr-xr-x  - cdsw cdsw          0 2018-10-12 11:18 models
drwxr-xr-x  - cdsw cdsw          0 2018-09-04 13:52 output
cdsw@6mzzmuu4vvgsbjy:~$
```

or

```
> !hdfs dfs -ls
Found 5 items
drwx-----  - cdsw cdsw          0 2018-10-05 13:00 .Trash
drwxr-xr-x  - cdsw cdsw          0 2018-10-12 11:23 .sparkStaging
-rw-r--r--  3 cdsw cdsw         71 2018-10-12 11:22 kmeans_data.txt
drwxr-xr-x  - cdsw cdsw          0 2018-10-12 11:18 models
drwxr-xr-x  - cdsw cdsw          0 2018-09-04 13:52 output
```

If everything went correctly you'll see that we demonstrate:

- Natural integration with HDFS - it's just a path to a file!
- Natural parallel computation across the cluster using Spark

### Lab 5 - Pushing the Boundaries

So you've just heard that the latest thing from Google is [Tensorflow](#) and you're keen to get started. You're going to need to install some customer packages and, more importantly, connect a program providing a web interface so that you can view the results. Your IT department isn't going to help you - you're going to want to do this experiment on your own.

Fortunately CDSW enables you to install custom libraries. This cluster might be managed by IT but you can still get your libraries in there to do the work you need ...

We've done the hard work for you - take a look:

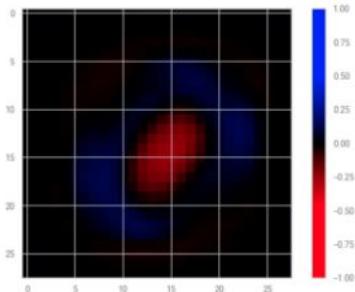

1. Select 3\_tensorflow.py
2. Lines 2 through 6 show the imports of the various libraries (we installed them in Step 3)
3. Run 3\_tensorflow.py in your current Python session (you might like to 'clear' your output screen first)- the input handwritten number images are shown, along with some images of feature maps for particular numbers

Examine layers

A red/black/blue colormap

```
> cdict = {'red': [(0.0, 1.0, 1.0),
      (0.25, 1.0, 1.0),
      (0.5, 0.0, 0.0),
      (1.0, 0.0, 0.0)],
    'green': [(0.0, 0.0, 0.0),
      (1.0, 0.0, 0.0)],
    'blue': [(0.0, 0.0, 0.0),
      (0.5, 0.0, 0.0),
      (0.75, 1.0, 1.0),
      (1.0, 1.0, 1.0)]}
> redblue = matplotlib.colors.LinearSegmentedColormap('red_black_blue',cdict,256)
> wts = W.eval(sess)
> for i in range(0,5):
    im = wts.flatten()[i::10].reshape((28,-1))
    plt.imshow(im, cmap = redblue, clim=(-1.0, 1.0))
    plt.colorbar()
    print("Digit %d" % i)
    plt.show()
```

Digit 0

Key takeaways: You were able to install and use custom third party libraries, as well as run an application that you can connect to from an external application.

STOP all your Python sessions now (you should only have one but sometimes people get carried away). This will help ensure there are plenty of resources for you and the others in the workshop.

### Lab 6 - SparklyR

We've focused on python integration, but just to show we can do similar things with R, let's take a look at the R programs and execute them.

This lab requires that R is setup correctly. We provided instructions [earlier](#), but if you skipped them then do this:

Ensure that you've started up an R session (**2vCPU, 4GiB engine**) and executed lines 37 through 42 from the README.md file. You'll only have to do this once for this project so if you've already done it don't do it again.

1. Create a new R Session.

## Start New Session

### Engine Image - [Configure](#)

Base Image v6 - docker.repository.cloudera.com/cdsweb/engine:6

### Select Engine Kernel

- Python 2
- Python 3
- Scala
- R

### Select Engine Profile

1 vCPU / 4 GiB Memory

0 GPUs

[Launch Session](#)

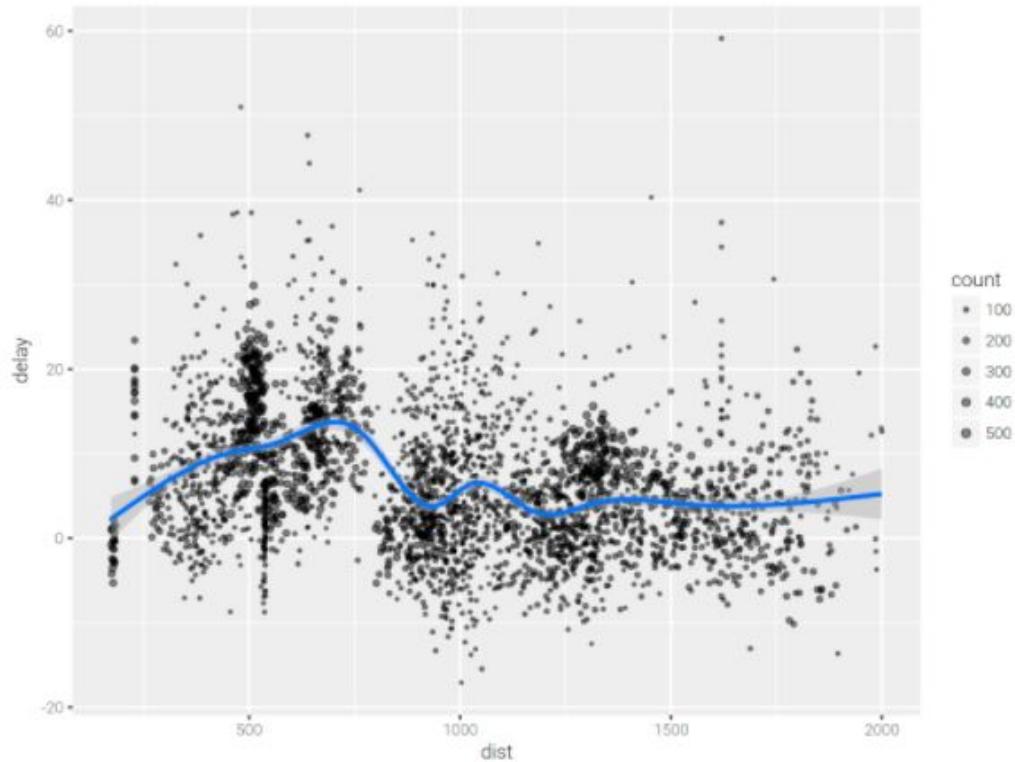

or

[Run Experiment..](#)

### 2. Select (and run) 4\_sparklyr.R

The right hand side output window should (eventually) look like this (more or less - depending on your screen real-estate):

```
`geom_smooth()` using method = 'gam'
```

## Machine Learning

You can orchestrate machine learning algorithms in a Spark cluster via the machine learning functions within sparklyr. connect to a set of high-level APIs built on top of DataFrames that help you create and tune machine learning workflow

In this example we'll use `ml_linear_regression` to fit a linear regression model. We'll use the built-in mtcars dataset, and predict a car's fuel consumption (`mpg`) based on its weight (`wt`) and the number of cylinders the engine contains (`cyl`). each case that the relationship between `mpg` and each of our features is linear.

```
copy mtcars into spark
```

```
> mtcars_tbl <- copy_to(sc, mtcars, overwrite = TRUE)
```

transform our data set, and then partition into 'training', 'test'

```
> partitions <- mtcars_tbl %>%
```

```
>
```

Have a read through the Machine Learning section

## Cloudera - Data Science Labs

3. Can you figure out some of the things it's doing? If you know R, and if you know sparklyr, then you can get detailed; if you don't know R then simply 'collapse' the output and see if you can make sense of the analysis without looking at any code ... hopefully you can!

### Lab 7 - Shiny

R has a great interactive experience using the shiny package. In this lab we'll create an interactive histogram and you can work with it to find out the frequency distribution of the period between Yellowstone Geyser eruptions!

1. clear the R session screen and then run the 5\_shiny.R application

This will start up a shiny server in the local context (line 16), and connect it to the server/ui code (in server.R and ui.R, respectively).

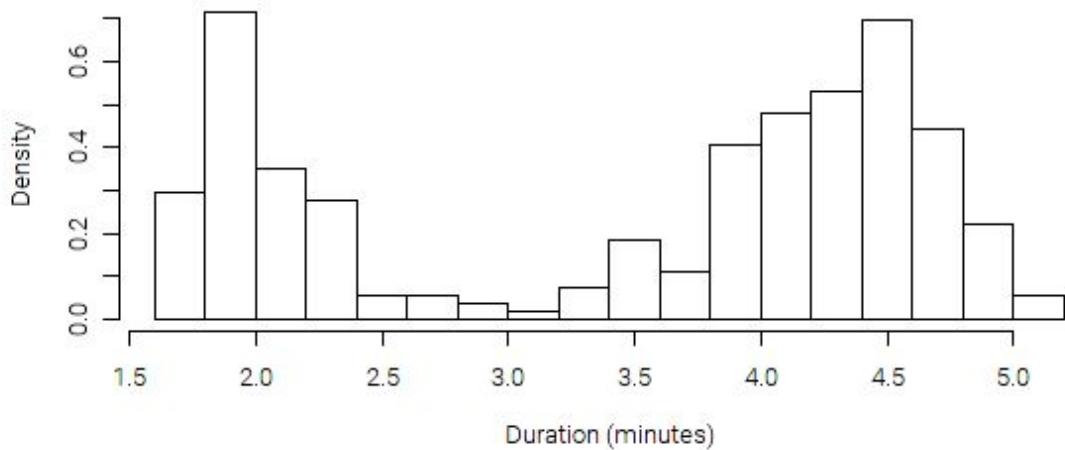

Your users are then presented with a nice little application where they can experiment with changing some of the parameters and graphing features of R's base graphics histogram plot!

**Number of bins in histogram (approximate):**

20

- Show individual observations**
- Show density estimate**

Geyser eruption duration

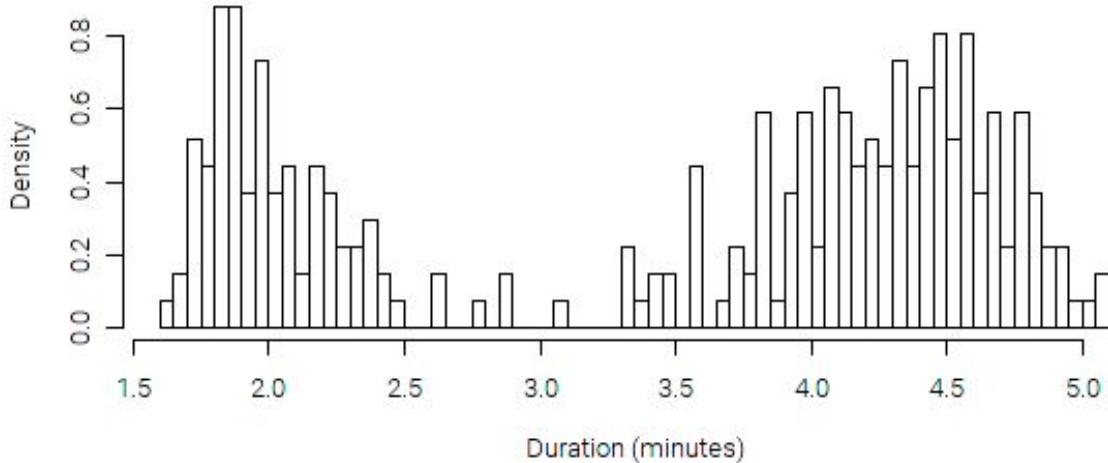

2. You can also change the number of bins in histogram to 50

Number of bins in histogram (approximate):

50

- Show individual observations
- Show density estimate

Geyser eruption duration

Try generating a share link and opening up the share in another browser window - amazingly enough each browser share is independent, allowing your users to share the same underlying experience, but with their individual data inputs!

When you've finished here then stop the R session just to free up some resources.

Have you Stopped the R Session ?

**Question:** Is this kind of interactivity with data likely to change the way your business users understand and appreciate the work of the Data Scientists?

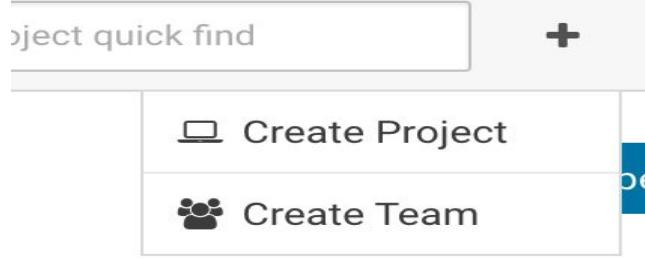

### Lab 8 - Scala

In this lab we show how you can use the ‘Template’ mechanism to get started with a simple Scala example. Note that the built in templates and example code aren’t written with multiple users in mind, so you might see file access and permission errors due to the fact that other students might’ve created or deleted files before you!:

1. Navigate to the project space by selecting “project”:

 Project

2. Create a new project by hitting the ‘+’ button on the top right and selecting ‘create project’:

3. In the Create new Project window that comes up provide a name for your new project ('Scala', for example), and then choose the Scala template in the Initial Setup drop down menu:

## Create a New Project

Project Name

Scala

Project Visibility

- Private** - Only added collaborators can view the project.
- Public** - All authenticated users can view this project.

Initial Setup

Blank

Template

Local

Git

Scala

Templates include example code to help you get started.

Create Project

4. Create the project. You'll see the File Browser view onto the project:

## Cloudera - Data Science Labs

The screenshot shows the Cloudera Data Science Labs interface. On the left is a sidebar with icons for Account, Overview, Sessions, Experiments, Models, Jobs, Files, Team, and Settings. The main area is titled 'Scala' and contains sections for 'Models' (with a note about no models yet), 'Jobs' (with a note about no jobs yet), and 'Files'. The 'Files' section lists several Scala files and configuration files, along with their sizes and last modified times. A 'Download' button is at the top right of the file list.

Name	Size	Last Modified
-	-	just now
-	-	just now
auction-analysis.scala	2.12 kB	just now
log4j.properties	21 B	just now
pi.scala	837 B	just now
README.md	2.05 kB	just now
spark-defaults.conf	88 B	just now
wordcount.scala	562 B	just now

5. Hit 'Open Workbench' in the top right and let's go run some Scala code:
6. Start a Scala session

### Select Engine Kernel

- Python 2
- Python 3
- Scala
- R

### Select Engine Profile

1 vCPU / 2 GiB Memory

Launch Session

or

Run Experiment..

7. The Scala example project includes its own data set that needs to be moved into HDFS, since that is where the scala code expects to find it. Open a terminal and execute the following shell commands to do this. Note how you have ready access to your own project's data (purely local to you) and the secure (and massive) HDFS cluster:

8. Open Terminal

9. `hdfs dfs -put -f data /user/$HADOOP_USER_NAME`

```
cdsw@44bi8vk24giecnf6:~$ hdfs dfs -put -f data /user/$HADOOP_USER_NAME
cdsw@44bi8vk24giecnf6:~$
```

10. Open example -> kmeans.scala, and edit the file as follows:

## Cloudera - Data Science Labs

Remove line 8, by adding // in front. This will mark it as comments and not execute it.

```
7 //load local data to hdfs
8 //hdfs dfs -put data/kmeans_data.txt /tmp" !
9
```

Modify line 11. The location of the input files is in your training directory. Make sure you refer to your training user number.

```
10 //example kmeans clustering script
11 val data = sc.textFile("/user/training20/kmeans_data.txt")
```

11. When the file is modified, run the program.

The screenshot shows a Scala IDE interface with two panes. The left pane displays the code for `kmeans.scala`, which includes imports for `org.apache.spark.mllib.clustering.KMeans` and `org.apache.spark.mllib.linalg.Vectors`, and various methods for loading data from HDFS and performing K-Means clustering. The right pane shows the terminal output of the Scala code execution, which includes importing Java file handling classes, loading local data to HDFS, running the example kmeans clustering script, and printing the final Within Set Sum of Squared Errors (WSSSE) value of 0.1199999999994547. It also shows the save operation and the resulting cluster centers: Cluster Center 0: [9.1, 9.1, 9.1] and Cluster Center 1: [0.1, 0.1, 0.1].

```
File Edit View Navigate Run examples/kmeans.scala
kmeans.scala
auction-analysis.scala
data
examples
kmeans.scala
movieALS.scala
log4.properties
pi.scala
README.md
spark-defaults.conf
wordcount.scala

1 import org.apache.spark.mllib.clustering.KMeans, KMeansModel
2 import org.apache.spark.mllib.linalg.Vectors
3 import org.apache.commons.io.FileUtils
4 import java.io.File
5 import sys.process._
6
7 //load local data to hdfs
8 //hdfs dfs -put data/kmeans_data.txt /tmp" !
9
10 //example kmeans clustering script
11 val data = sc.textFile("/user/training20/kmeans_data.txt")
12 val parsedData = data.map(s => Vectors.dense(s.split(' ').map(_.toDouble))).cache()
13
14 // Cluster the training data set into two classes with KMeans
15 val numClusters = 2
16 val numIterations = 20
17 val clusters = KMeans.train(parsedData, numClusters, numIterations)
18
19 // Evaluate clustering by computing Within Set Sum of Squared Errors
20 val WSSSE = clusters.computeCost(parsedData)
21 println(s"Within Set Sum of Squared Errors = $WSSSE")
22
23 // Save the model
24 val output = "output/KMeansExample/KMeansModel"
25 FileUtils.deleteQuietly(new File(output))
26 clusters.save(sc, output)
27
28 //example of loading and predicting on the model we created
29 val sameModel = KMeansModel.load(sc, output)
30 sameModel.clusterCenters.zipWithIndex.foreach { case (center, idx) =>
31   println(s"Cluster Center ${idx}: ${center}")
32 }
33 sameModel.predict(Vectors.dense(7,5,6))
34

> import java.io.File
> import sys.process._
> load local data to hdfs
> "hdfs dfs -put data/kmeans_data.txt /tmp" !
> example kmeans clustering script
> val data = sc.textFile("/user/training20/kmeans_data.txt")
> val parsedData = data.map(s => Vectors.dense(s.split(' ').map(_.toDouble))).cache()
> Cluster the training data set into two classes with KMeans
> val numClusters = 2
> val numIterations = 20
> val clusters = KMeans.train(parsedData, numClusters, numIterations)
> Evaluate clustering by computing Within Set Sum of Squared Errors
> val WSSSE = clusters.computeCost(parsedData)
> println(s"Within Set Sum of Squared Errors = $WSSSE")
> Within Set Sum of Squared Errors = 0.1199999999994547
> Save the model
> val output = "output/KMeansExample/KMeansModel"
> FileUtils.deleteQuietly(new File(output))
> false
> clusters.save(sc, output)
> example of loading and predicting on the model we created
> val sameModel = KMeansModel.load(sc, output)
> sameModel.clusterCenters.zipWithIndex.foreach { case (center, idx) =>
>   println(s"Cluster Center ${idx}: ${center}")
> }
> Cluster Center 0: [9.1, 9.1, 9.1]
> Cluster Center 1: [0.1, 0.1, 0.1]
> sameModel.predict(Vectors.dense(7,5,6))
> 0
```

If you get a `FileNotFoundException` executing '`clusters.save(sc,output)`' then you can ignore the error and finish this lab by just executing the lines after that one:

## Cloudera - Data Science Labs

```
> clusters.save(sc, output)
❷ Name: org.apache.hadoop.mapred.FileAlreadyExistsException

```

**Question:** How will you use templates when demonstrating CDSW to your friends and colleagues?

Remember to stop your scala Session

## Lab 9 - Project Creation using Local Files

1. Create a new project, naming it 'Local', and select the 'Local tab':

### Create a New Project

Project Name

Local

Project Visibility

- Private** - Only added collaborators can view the project.
- Public** - All authenticated users can view this project.

Initial Setup

Blank

Template

Local

Git

[Upload .zip or .tar.gz](#)

[Upload folder](#)

 Or Drag and Drop Files Here

[Create Project](#)

2. Try adding a file or folder and then create your project
3. If you have some code you want to try then select that - otherwise just note that the project was created from the file(s) you selected.

4. You might've noticed in the File browser window that the ability to upload and download files is there for a project, no matter how you started the project:

The screenshot shows the CDSW interface for a user named 'toby2' titled 'My Blank Project'. The left sidebar has icons for Account, Overview (selected), Jobs, Sessions, Files, Team, and Settings. The main area shows the project title 'My Blank Project' with a lock icon, 0 forks, and a 'Open Workbench' button. Below it is a 'Jobs' section stating 'This project has no jobs yet. Create a new job to document your analytics pipelines.' Under 'Files', there's a table with two entries: 'cdsw-demo-short' and 'R'. A download, new file, and upload button are above the table. At the bottom, a message encourages adding a README.md file.

	Name	Size	Last Modified
<input type="checkbox"/>	cdsw-demo-short	-	yesterday
<input type="checkbox"/>	R	-	yesterday

This project doesn't contain a README.md file. Consider adding one that describes your project.

**Question:** With the combination of git, blank projects and uploading from a local file system on your laptop do you feel pretty confident you can get the data and code you want into the CDSW environment?

### Lab 10 - Scheduling Jobs

It's often the case that you need to execute tasks on a periodic basis, and to execute one or more tasks once some other task has succeeded. Obviously there are sophisticated workflow engines but for simple workflows CDSW has a jobs system built in.

This lab goes through the mechanics of creating a simple multi-step job process.

1. Open up your 'cdsw workshop' project to get to this screen:

Name	Size	Last Modified
data	-	1 hour ago
R	-	56 minutes ago
spark-warehouse	-	33 minutes ago
1.python.py	3.00 kB	1 hour ago
2.pyspark.py	1.60 kB	1 hour ago
3.tensorflow.py	3.39 kB	1 hour ago
4.sparkly.R	2.50 kB	1 hour ago
5.shiny.R	769 B	1 hour ago
README.md	1.74 kB	1 hour ago
server.R	536 B	1 hour ago
spark-defaults.conf	74 B	1 hour ago
ui.R	689 B	1 hour ago
util.py	1.09 kB	1 hour ago
util.pyc	1.48 kB	27 minutes ago

2. You need to be in a project to create a Job
3. Select the 'new job' link in the middle of the page, and you'll get to the following screen (there are other ways of getting to this next screen - its an exercise for the student to figure out what they might be):

## Cloudera - Data Science Labs

Create a Job

### General

Name  
my new job

Script  
1\_python.py 

Engine Kernel  
 Python 3  
 Python 2  
 Scala  
 R

Schedule  
Manual

Engine Profile  
1 vCPU / 2 GiB Memory

GPUs  
0 GPUS

Timeout In Minutes (optional)   Kill on Timeout

.Jobs exceeding timeout send warning email if notifications enabled.

4. Create a job that will be triggered manually and will execute the 1\_python.py. Here are the parameters to do that:

Name	My New Job
Script	1_python.py
Engine Kernel	Python 3

5. Leave everything else as **default**. Scroll down and hit 'Create Job'. You should get to this screen:

## Cloudera - Data Science Labs

test CDSW Demo Test Jobs

Project quick find + test

Overview Sessions Experiments Models Jobs Files Team Settings

License Expires in 58 days

1.4.0.431664 (01ac70a)

Jobs

Job Dependencies for My New Job

+ Add Job Dependency

Name	Runs / Failures	Duration	Status	Latest Run	Actions
My New Job	0 / 0	00.00	Not Yet Run	-	<button>Run</button>

6. Here you can see that you have a job ('My New Job'). It's never been run, and it has no dependencies.
7. Let's make other jobs depend on this one: Click the '+ Add Job Dependency' grayed out button and add a new job that has a dependency on 'My New Job'. The parameters are:

Name	Job 2
Script	2_pyspark.py
Engine Kernel	Python 3

## Cloudera - Data Science Labs

**Name**  
Job 2

**Script**  
2\_pyspark.py 

**Engine Kernel**  
 Python 2  
 Python 3  
 Scala  
 R

**Schedule**  
Dependent   
My New Job 

**Engine Profile**  
0.5 vCPU / 2 GiB Memory 

**GPUs**  
0 GPUs 

**Timeout In Minutes (optional)** 30  Kill on Timeout  
Jobs exceeding timeout send warning email if notifications enabled.

[Set Environmental Variables](#)

8. Scroll down and ‘Create Job’. You’ll now see a page like this:

## Cloudera - Data Science Labs

The screenshot shows a web-based interface for managing data science workshops. On the left, a sidebar includes links for Overview, Jobs, Sessions, Files, Team, and Settings. A license status message at the bottom left says "License Expires in 59 days". The main area displays a dependency graph where "My New Job" depends on "Job 2". Below the graph is a table of jobs:

Name	Runs / Failures	Duration	Status	Latest Run	Actions
Job 2	0 / 0	00:00	Not Yet Run	-	<button>Run</button>
My New Job	0 / 0	00:00	Not Yet Run	-	<button>Run</button>

At the bottom right of the main area, it says "1.0.1 (052787a)".

9. So here we can see that 'Job 2' depends upon 'My New Job' (although you can run each manually, if you so choose).
10. Lets add another job that will run in parallel with Job2:
11. Click 'New Job' in the top right corner and create another job that depends upon 'My New Job'. The parameters you'll need are:

Name	R Job
Script	4_sparklyr.R
Engine Kernel	R
Schedule	Dependent / My New Job

## Cloudera - Data Science Labs

### General

Name

Script  
 

Engine Kernel  
 Python 2  
 Python 3  
 Scala  
 R

Schedule  
   
 

Engine Profile  
 

Timeout In Minutes (optional)   Kill on Timeout

Jobs exceeding timeout send warning email if notifications enabled.

[Set Environmental Variables](#)

12. Create the job and you'll see this:

## Cloudera - Data Science Labs

The screenshot shows the Cloudera Data Science Workshops interface. On the left is a sidebar with icons for Overview, Jobs, Sessions, Files, Team, and Settings. The main area has tabs for Overview, Sessions, Files, and Team. The 'Jobs' tab is selected. A sub-header 'Job Dependencies for My New Job' is shown above a diagram where 'My New Job' depends on 'Job 2' and 'R job'. Below the diagram is a table of three jobs:

Name	Runs / Failures	Duration	Status	Latest Run	Actions
R job	0 / 0	00:00	Not Yet Run	-	<button>Run</button>
Job 2	0 / 0	00:00	Not Yet Run	-	<button>Run</button>
My New Job	0 / 0	00:00	Not Yet Run	-	<button>Run</button>

A license status message 'License Expires in 59 days' is at the bottom left, and a version '1.0.1 (052787a)' is at the bottom right.

13. Lets run it all - hit the 'Run' button next to 'My New Job' (bottom of the list of jobs). You should see the job get scheduled, run, complete, and then the next two jobs should likewise get scheduled, run and complete:

The screenshot shows the same interface after the 'Run' button was clicked for 'My New Job'. The table now shows the following results:

Name	Runs / Failures	Duration	Status	Latest Run	Actions
Job 2	1 / 0	00:29	Success	just now	<button>Run</button>
R job	1 / 0	01:19	Success	just now	<button>Run</button>
My New Job	1 / 0	00:03	Success	just now	<button>Run</button>

**Question:** How will a job scheduler reduce the effort required for you to build simple pipelines?

**Question:** What other facilities surrounding a job did we not explain? What do you think those other parameters might do?

### **Lab 11 – Experiments**

Starting with version 1.4, Cloudera Data Science Workbench allows data scientists to run batch experiments that track different versions of code, input parameters, and output (both metrics and files).

#### **Challenge**

As data scientists iteratively develop models, they often experiment with datasets, features, libraries, algorithms, and parameters. Even small changes can significantly impact the resulting model. This means data scientists need the ability to iterate and repeat similar experiments in parallel and on demand, as they rely on differences in output and scores to tune parameters until they obtain the best fit for the problem at hand. Such a training workflow requires versioning of the file system, input parameters, and output of each training run.

Without versioned experiments you would need intense process rigor to consistently track training artifacts (data, parameters, code, etc.), and even then it might be impossible to reproduce and explain a given result. This can lead to wasted time/effort during collaboration, not to mention the compliance risks introduced.

#### **Solution**

Starting with version 1.4, Cloudera Data Science Workbench uses experiments to facilitate ad-hoc batch execution and model training. Experiments are batch executed workloads where the code, input parameters, and output artifacts are versioned. This feature also provides a lightweight ability to track output data, including files, metrics, and metadata for comparison.

#### **Concepts**

The term experiment refers to a non interactive batch execution script that is versioned across input parameters, project files, and output. Batch experiments are associated with a specific project (much like sessions or jobs) and have no notion of scheduling; they run at creation time. To support versioning of the project files and retain run-level artifacts and metadata, each experiment is executed in an isolated container.

#### **Lifecycle of an Experiment**

## Cloudera - Data Science Labs

### Step 1: Create a new project

Go to the homepage of your Data Science workbench, and create a 'New' project.

Call the new repository something like Experiments and Models.

Create the repository as a clone of the github repository:

[https://github.com/jmuselaers/experiments\\_models\\_tellarius](https://github.com/jmuselaers/experiments_models_tellarius)

#### Create a New Project

##### Project Name

Experiments and Models

##### Project Visibility

**Private** - Only added collaborators can view the project.

**Public** - All authenticated users can view this project.

##### Initial Setup

Blank

Template

Local

Git

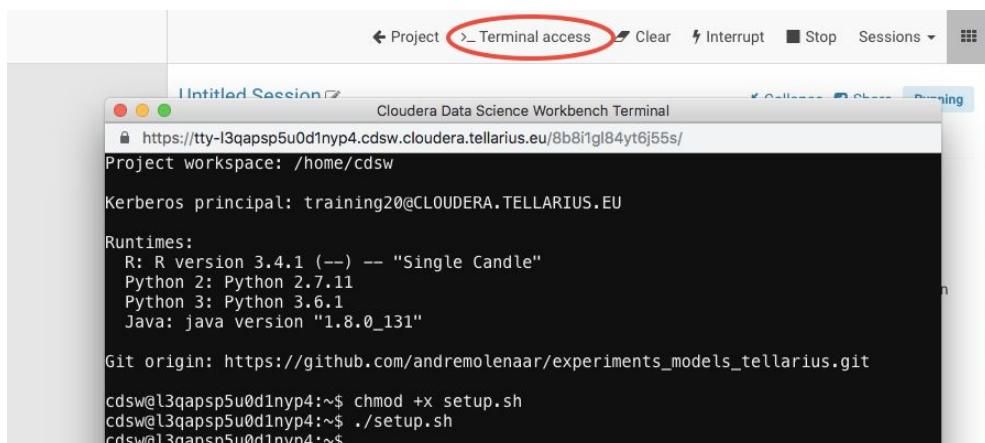

<https://github.com/andremolenaar/dsfortelcoCDSW.git>

**Create Project**

Start a workbench with a Python 3 and 4 GB of memory.

When the workbench is available, open a terminal window and make the cdsw-build.sh program executable. Use the following command to do that:

```
chmod +x setup.sh  
./setup.sh
```

The screenshot shows a terminal window titled 'Untitled Session' within the Cloudera Data Science Workbench. The terminal has a red circle around the 'Terminal access' button in the top bar. The terminal output is as follows:

```
Cloudera Data Science Workbench Terminal  
Project workspace: /home/cdsw  
Kerberos principal: training20@CLOUDERA.TELLARIUS.EU  
Runtimes:  
R: R version 3.4.1 (--) -- "Single Candle"  
Python 2: Python 2.7.11  
Python 3: Python 3.6.1  
Java: java version "1.8.0_131"  
Git origin: https://github.com/andremolenaar/experiments_models_tellarius.git  
cdsw@l3qapsp5u0d1nyp4:~$ chmod +x setup.sh  
cdsw@l3qapsp5u0d1nyp4:~$ ./setup.sh  
cdsw@l3qapsp5u0d1nyp4:~$
```

### **Step 2: Examin dsfortelco\_sklearn\_exp.py**

Open the file “dsfortelco\_sklearn\_exp.py”. This is a python program that builds a churn model to predict customer churn (the likelihood that this customer is going to stop his subscription with his telecom operator). There is a dataset available on hdfs (/tmp/churn\_all.csv), with customer data, including a churn indicator field.

The program is going to build a churn prediction model using the Random Forest algorithm. Random forests are ensembles of decision trees. Random forests are one of the most successful machine learning models for classification and regression. They combine many decision trees in order to reduce the risk of overfitting. Like decision trees, random forests handle categorical features, extend to the multiclass classification setting, do not require feature scaling, and are able to capture non-linearities and feature interactions.

spark.mllib supports random forests for binary and multiclass classification and for regression, using both continuous and categorical features. spark.mllib implements random forests using the existing decision tree implementation. Please see the decision tree guide for more information on trees.

The Random Forest algorithm expects a couple of parameters:

- numTrees: Number of trees in the forest.

Increasing the number of trees will decrease the variance in predictions, improving the model’s test-time accuracy.

Training time increases roughly linearly in the number of trees.

- maxDepth: Maximum depth of each tree in the forest.

Increasing the depth makes the model more expressive and powerful. However, deep trees take longer to train and are also more prone to overfitting.

In general, it is acceptable to train deeper trees when using random forests than when using a single decision tree. One tree is more likely to overfit than a random forest (because of the variance reduction from averaging multiple trees in the forest).

In the dsfortelco\_pyspark\_exp.py program, these parameters can be passed to the program at runtime. In the lines 38 and 39, these parameters are passed to python variables:

```
param_numTrees=int(sys.argv[1])  
param_maxDepth=int(sys.argv[2])
```

Also note that at the lines 69 and 70, the quality indicator for the Random Forest model, are written back to the Data Science Workbench repository:

```
cdsw.track_metric("auroc", auroc)  
cdsw.track_metric("ap", ap)
```

These indicators will show up later in the Experiments dashboard.

## Cloudera - Data Science Labs

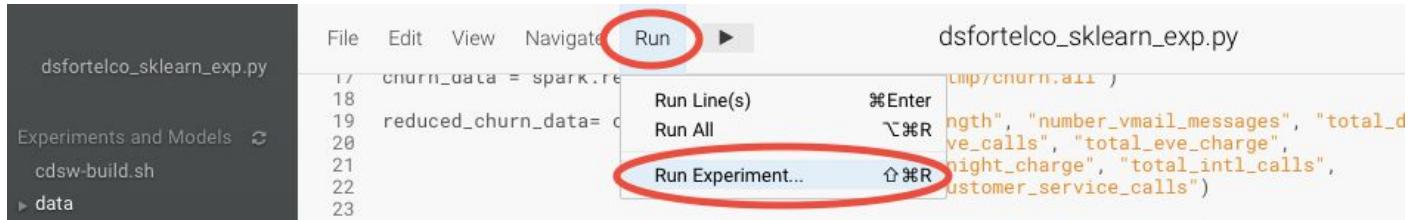

### **Step 3: Run the experiment for the first time**

Now, run the experiment using the following parameters:

numTrees = 40

numDepth = 20

From the menu, select Run -> Experiments.

Specify the arguments for this run, by typing the numbers behind the arguments field. Note that these fields are separated by a space and that there is no comma (,)

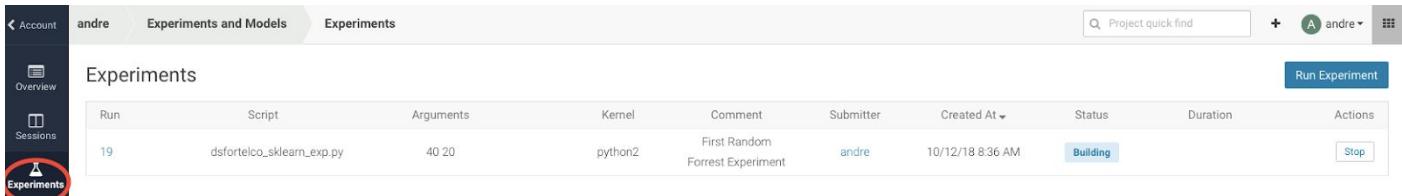

A screenshot of the 'Run New Experiment' dialog. It has fields for 'Script' (set to 'dsfortelco\_sklearn\_exp.py'), 'Arguments' (set to '40 20'), 'Engine Kernel' (radio buttons for Python 2, Python 3, Scala, and R, with Python 3 selected), 'Engine Profile' (dropdown set to '0.5 vCPU / 1 GiB Memory'), and a 'Comment' field (containing 'First Random Forrest Experiment'). At the bottom are 'Cancel' and 'Start Run' buttons.

Now, in the background, the Data Science Workbench environment will spin up a new docker container, where this program will run.

## Cloudera - Data Science Labs

### Step 4: Check the results for the first experiment

Go back to the ‘Projects’ page in CDSW, and hit the ‘Experiments’ button.

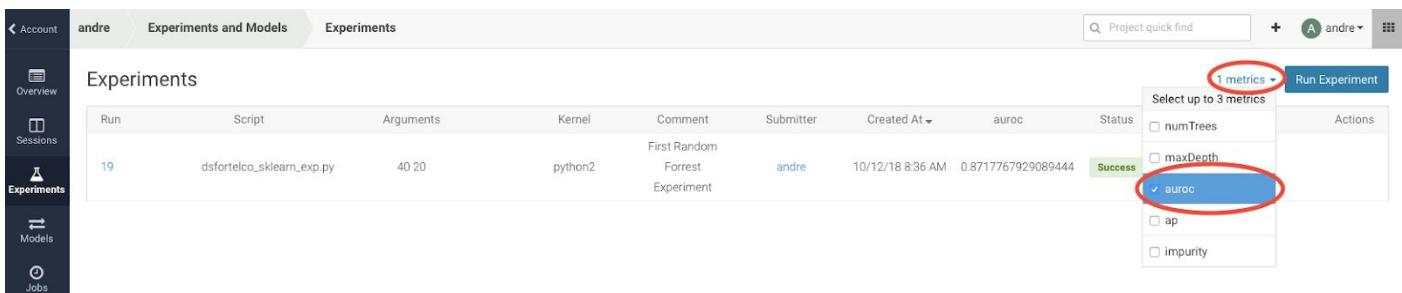

Run	Script	Arguments	Kernel	Comment	Submitter	Created At	Status	Duration	Actions
19	dsfortelco_sklearn_exp.py	40 20	python2	First Random Forrest Experiment	andre	10/12/18 8:36 AM	Building		<button>Stop</button>

If the Status indicates ‘Running’, you have to wait till the run is completed.

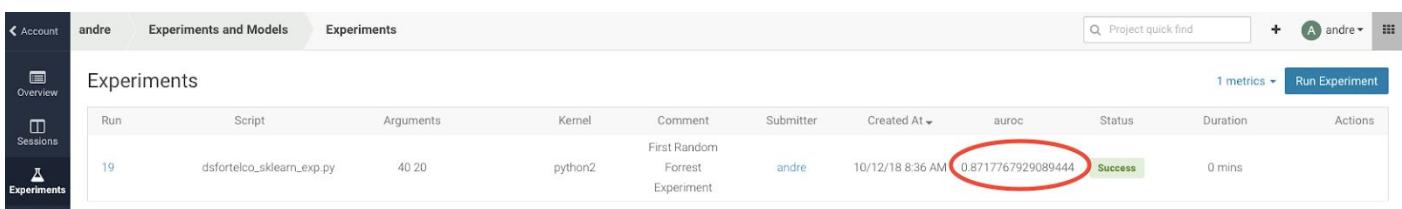

In case the status is ‘Build Failed’ or ‘Failed’, check the log information. This is accessible by clicking on the run number of your experiments. There you can find the session log, as well as the build information.

In case your status indicates ‘Success’, you should be able to see the auroc (Area Under the Curve) model quality indicator. It might be that this value is hidden by the CDSW user interface. in that case, click on the ‘3 metrics’ links, and select the auroc field. It might be needed to de-select some other fields, since the interface can only show 3 metrics at the same time.

Run	Script	Arguments	Kernel	Comment	Submitter	Created At	auroc	Status	Actions
19	dsfortelco_sklearn_exp.py	40 20	python2	First Random Forrest Experiment	andre	10/12/18 8:36 AM	0.8717767929089444	Success	<button>Run Experiment</button>

When the auroc metric is selected, you will be able to see the value.

Run	Script	Arguments	Kernel	Comment	Submitter	Created At	auroc	Status	Duration	Actions
19	dsfortelco_sklearn_exp.py	40 20	python2	First Random Forrest Experiment	andre	10/12/18 8:36 AM	0.8717767929089444	Success	0 mins	<button>Run Experiment</button>

In this example, 0.871

Not bad, but maybe there are better hyper parameter values available.

## Cloudera - Data Science Labs

### **Step 5: Re run the experiment several times**

Now, re-run the experiment 3 more times and try different values for NumTrees and NumDepth.  
Try the following values:

NumTrees	NumDepth
15	25
25	20
Try something yourself	Try something yourself

When all runs have completed successfully, check which parameters had the best quality (best predictive value). This is represented by the highest 'area under the curve', auroc metric.

Run	Script	Arguments	Kernel	Comment	Submitter	Created At	numTrees	maxDepth	auroc	Status	Duration	Actions
22	dsfortelco_sklearn_exp.py	20 30	python2	Fourth Experiment	andre	10/12/18 8:47 AM	20	30	0.8392243291195386	Success	0 mins	<button>Run Experiment</button>
21	dsfortelco_sklearn_exp.py	25 20	python2	Third Experiment	andre	10/12/18 8:46 AM	25	20	0.8502144506763445	Success	0 mins	<button>Run Experiment</button>
20	dsfortelco_sklearn_exp.py	15 25	python2	Second Experiment	andre	10/12/18 8:46 AM	15	25	0.8178173020922	Success	1 mins	<button>Run Experiment</button>
19	dsfortelco_sklearn_exp.py	40 20	python2	First Random Forrest Experiment	andre	10/12/18 8:36 AM	40	20	0.8717767929089444	Success	0 mins	<button>Run Experiment</button>

In this example, run 21 had the highest auroc value, so that is the model that you would want to use for your business.

### **Step 6: Save the best model to your environment**

Select the run number with the best predictive value, in this example, run number 21.

Run	Script	Arguments	Kernel	Comment	Submitter	Created At	numTrees	maxDepth	auroc	Status	Duration	Actions
22	dsfortelco_sklearn_exp.py	20 30	python2	Fourth Experiment	andre	10/12/18 8:47 AM	20	30	0.8392243291195386	Success	0 mins	<button>Run Experiment</button>
21	dsfortelco_sklearn_exp.py	25 20	python2	Third Experiment	andre	10/12/18 8:46 AM	25	20	0.8502144506763445	Success	0 mins	<button>Run Experiment</button>
20	dsfortelco_sklearn_exp.py	15 25	python2	Second Experiment	andre	10/12/18 8:46 AM	15	25	0.8178173020922	Success	1 mins	<button>Run Experiment</button>
19	dsfortelco_sklearn_exp.py	40 20	python2	First Random Forrest Experiment	andre	10/12/18 8:36 AM	40	20	0.8717767929089444	Success	0 mins	<button>Run Experiment</button>

## Cloudera - Data Science Labs

In the Overview screen of the experiment, you can see that the model in spark format, is captured in the file 'sklearn\_rf.pkl'. Select this file and hit the 'Add to Project' button. This will copy the model to your project directory.

The screenshot shows the Cloudera Data Science Labs interface. The top navigation bar includes 'Account' (with user 'andre'), 'Experiments and Models' (selected), 'Experiments' (21), and 'Overview'. On the left, a sidebar lists various categories: Overview, Sessions, Experiments, Models, Jobs, Files, Team, and Settings. The main content area displays 'Run-21' with a 'New Experiment' button. Below it, tabs for 'Overview', 'Session', and 'Build' are shown, with 'Overview' selected. The 'Configuration' section lists: Script (dsfortelco\_sklearn\_exp.py), Arguments (25 20), Comment (Third Experiment), Build Snapshot (77e3b0ce1cf6b010c840e282aeda6d7ffd8dc248), Created At (10/12/18 8:46 AM), and Submitter (andre). The 'Metrics' section lists: numTrees (25), maxDepth (20), impurity (gini), auroc (0.8502144506763445), and ap (0.680864067072068). To the right, under 'Output', a checkbox for 'sklearn\_rf.pkl' is checked and highlighted with a red oval. Below it, a button labeled 'Add to Project' is also highlighted with a red oval.

### **Lab 12 – Working with Models**

Starting with version 1.4, Cloudera Data Science Workbench allows data scientists to build, deploy, and manage models as REST APIs to serve predictions.

#### **Challenge**

Data scientists often develop models using a variety of Python/R open source packages. The challenge lies in actually exposing those models to stakeholders who can test the model. In most organizations, the model deployment process will require assistance from a separate DevOps team who likely have their own policies about deploying new code.

For example, a model that has been developed in Python by data scientists might be rebuilt in another language by the devops team before it is actually deployed. This process can be slow and error-prone. It can take months to deploy new models, if at all. This also introduces compliance risks when you take into account the fact that the new re-developed model might not be even be an accurate reproduction of the original model.

Once a model has been deployed, you then need to ensure that the devops team has a way to rollback the model to a previous version if needed. This means the data science team also needs a reliable way to retain history of the models they build and ensure that they can rebuild a specific version if needed. At any time, data scientists (or any other stakeholders) must have a way to accurately identify which version of a model is/was deployed.

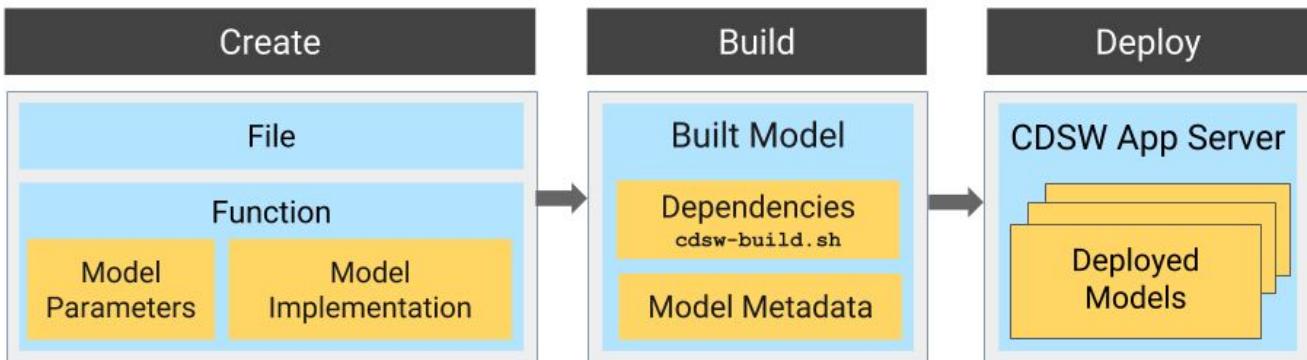

#### **Solution**

Starting with version 1.4, Cloudera Data Science Workbench allows data scientists to build and deploy their own models as REST APIs. Data scientists can now select a Python or R function within a project file, and Cloudera Data Science Workbench will:

- Create a snapshot of model code, model parameters, and dependencies.
- Package a trained model into an immutable artifact and provide basic serving code.
- Add a REST endpoint that automatically accepts input parameters matching the function, and that returns a data structure that matches the function's return type.
- Save the model along with some metadata.
- Deploy a specified number of model API replicas, automatically load balanced.

## Cloudera - Data Science Labs

### Stages of the Model Deployment Process

### **Step 1: Examine the program `predic_churn_sklearn.py`**

Open the project you created in the previous lab, and examine the file.

```
1 import pickle
2 import numpy as np
3
4 model = pickle.load(open("models/sklearn_rf.pkl", "rb"))
5
6 def predict(args):
7     account=np.array(args["feature"].split(",")).reshape(1,-1)
8     return {"result": model.predict(account)[0]}
9
10
```

This PySpark program uses the `pickle.load` mechanism to deploy models.. The model it refers to the `sklearn_rf.pkl` file, was saved in the previous lab from the experiment with the best predictive model.

There is a `predict` definition which is the function that calls the model, using features, and will return a `result` variable.

### **Step 2: Deploy the model**

From the projects page of your project, select the 'Models' button.

## Cloudera - Data Science Labs

The screenshot shows the 'Experiments and Models' page for a user named 'andre'. On the left, there's a sidebar with icons for Overview, Sessions, Experiments (which is highlighted with a red circle), and Jobs. The main area displays the 'Experiments and Models' section, which includes a summary bar showing '1 running' experiments. Below this, there are sections for 'Models' (indicating no models yet) and 'Jobs' (indicating no jobs yet). A '...' button is also present.

Select 'New Model', and populate specify the following configuration:

Name: something like "My Churn Prediction Model"  
Description: Anything you want  
File: predict\_churn\_sklearn.py  
Function: predict  
Example Inp: {  
                  "feature": "0, 65, 0, 137, 21.95, 83, 19.42, 111, 9.4, 6, 3.43, 4"  
                  }  
Kernal: Python 3  
Engine: 0.5 vCPU / 2 GiB Memory  
Replicas: 1

## Cloudera - Data Science Labs

[Set Environmental Variables](#)

If all parameters are set, you can hit the 'Deploy Model' button. Wait till the model is deployed. This will take several minutes.

## Cloudera - Data Science Labs

The screenshot shows the 'Models' section of the Cloudera Data Science Platform. On the left, there's a sidebar with 'Overview', 'Sessions', and 'Experiments'. The main area has tabs for 'Experiments and Models' and 'Models'. A search bar at the top right says 'Project quick find'. Below it is a table with columns: Model, Status, Replicas, CPU, Memory, Created By, Deployed By, Last Deployed, and Actions. One row is visible: 'My Churn Prediction Model' with status 'Building', 0/1 replicas, 0 CPU, 0 GiB memory, created by andre, deployed by andre, last deployed on Oct 12, 2018, 9:13 AM, and a 'Stop' button.

### Step 3: Test the deployed model

After the several minutes, your model should get to the 'Deployed' state.

This screenshot is similar to the previous one, but the 'My Churn Prediction Model' row in the table now has 'Status' set to 'Deployed' (highlighted with a red circle). All other details remain the same: 1/1 replicas, 1 CPU, 2 GiB memory, created by andre, deployed by andre, last deployed on Oct 12, 2018, 9:15 AM, and a 'Stop' button.

Now, click on the Model Name link, to go to the Model Overview page. From that page, hit the 'Test' button to check if the model is working.

This screenshot shows the 'My Churn Prediction Model' overview page. The left sidebar includes 'Overview', 'Sessions', 'Experiments', 'Models' (which is selected), 'Jobs', 'Files', 'Team', and 'Settings'. The main content area has tabs for 'Overview', 'Deployments', 'Builds', 'Monitoring', and 'Settings'. Under 'Overview', there's a 'Description' field with 'My Churn Prediction Model', a 'Sample Code' section with 'Shell', 'Python', and 'R' buttons, and a 'curl' command example. Below that is a 'Test Model' section with an 'Input' text area containing JSON input data and a 'Test' button (circled in red). To the right are two tables: 'Model Details' and 'Model Resources'. The 'Model Details' table includes fields like Model Id (10), Deployment (49), Build (10), Deployed By (andre), Comment (Initial revision.), Kernel (python2), Engine Image (Base Image v5), File (predict\_churn\_sklearn.py), and Function (predict). The 'Model Resources' table includes Replicas (1), Total CPU (1 vCPUs), and Total Memory (2 GiB).

If your model is working, you should receive an output similar like this:

## Cloudera - Data Science Labs

### Test Model

#### Input

```
{  
  "feature": "0, 65, 0, 137, 21.95, 83, 19.42, 111, 9.4  
, 6, 3.43, 4"  
}
```

**Test**   **Reset**

#### Result

Status	<span style="color: green;">●</span> success
Response	{ "result": 1 }
Replica ID	my-churn-prediction-model-10-49-599d6548d8-x9cmp

The green color with success is telling that our REST call to the model is technically working. And if you examine the response: {"result": 1}, it returns a 1, which mean that customer with these features is likely to churn.

Now, lets change the input parameters and call the predict function again. Put the following values in the Input field:

```
{  
  "feature": "0, 95, 0, 88, 26.62, 75, 21.05, 115, 8.65, 5, 3.32, 3"  
}
```

## Cloudera - Data Science Labs

### Test Model

#### Input

```
{  
  "feature": "0, 95, 0, 88, 26.62, 75, 21.05, 115, 8.65  
, 5, 3.32, 3"  
}
```

Test

Reset

#### Result

Status	<span>success</span>
Response	{ "result": 0 }
Replica ID	my-churn-prediction-model-10-49-599d6548d8-x9cmp

With these input parameters, the model returns 0, which mean that the customer is not likely to churn.

### Step 4: Model Administration

When a model is deployed, Cloudera Data Science Workbench allows you to specify a number of replicas that will be deployed to serve requests. For each active model, you can monitor its replicas by going to the model's Monitoring page. On this page you can track the number of requests being served by each replica, success and failure rates, and their associated stderr and stdout logs. Depending on future resource requirements, you can increase or decrease the number of replicas by re-deploying the model.

The screenshot shows the Cloudera Data Science Workbench interface. On the left is a sidebar with icons for Account, Experiments and Models, Models, My Churn Prediction Model (selected), Deployments, Sessions, Experiments, Jobs, Files, Team, and Settings. The main area has a header with 'andre' and tabs for 'Experiments and Models', 'Models', 'My Churn Prediction Model' (selected), and 'Deployments'. Below the header is a search bar and a button for 'andre'. The 'Deployments' tab is selected, showing a table with one row. The table columns are 'Id', 'Build', 'Status', 'Deployed At', 'Stopped At', and 'Deployed By'. The row contains values: Id 49, Build 1, Status Deployed, Deployed At Oct 12, 2018, 9:15 AM, Stopped At, Deployed By andre. To the right of the table is a detailed view of the deployment. It includes sections for 'Model' (Id 10, Name My Churn Prediction Model, Description My Churn Prediction Model), 'Build' (Build Number 1, UUID 467bc1db-8d7f-485e-adca-27ef6ee5e2b4, File predict\_churn\_.sklearn.py, Function predict, Kernel python2, Engine Base Image v5), and 'Deployment' (Re-deploy This Build button circled in red). There are also 'Deployed', 'Stop', 'Restart', and 'Deploy New Build' buttons at the top right of the deployment section.

## Cloudera - Data Science Labs

When you get to the re-deployment page, you can increase the number of replica's.

The screenshot shows the 'Build' and 'Deployment' sections of the deployment page. In the 'Deployment' section, the 'Replicas' input field is circled in red, showing the value '1'. Below it is a 'Deploy Model' button, also circled in red.

In order not to overload the cluster, hit the 'Cancel' button to return to the running model page.

Now, navigate to the 'Monitoring' tab.

Replica	Status	Received	Processed	Success	Failure	Error	Busy	Not Ready	Restart
my-churn-prediction-model-10-49-599d6548d8-x9cmp	Ready	5	5 (100 %)	5 (100 %)	0	0	0	0	0

Streams:  stdout  stderr

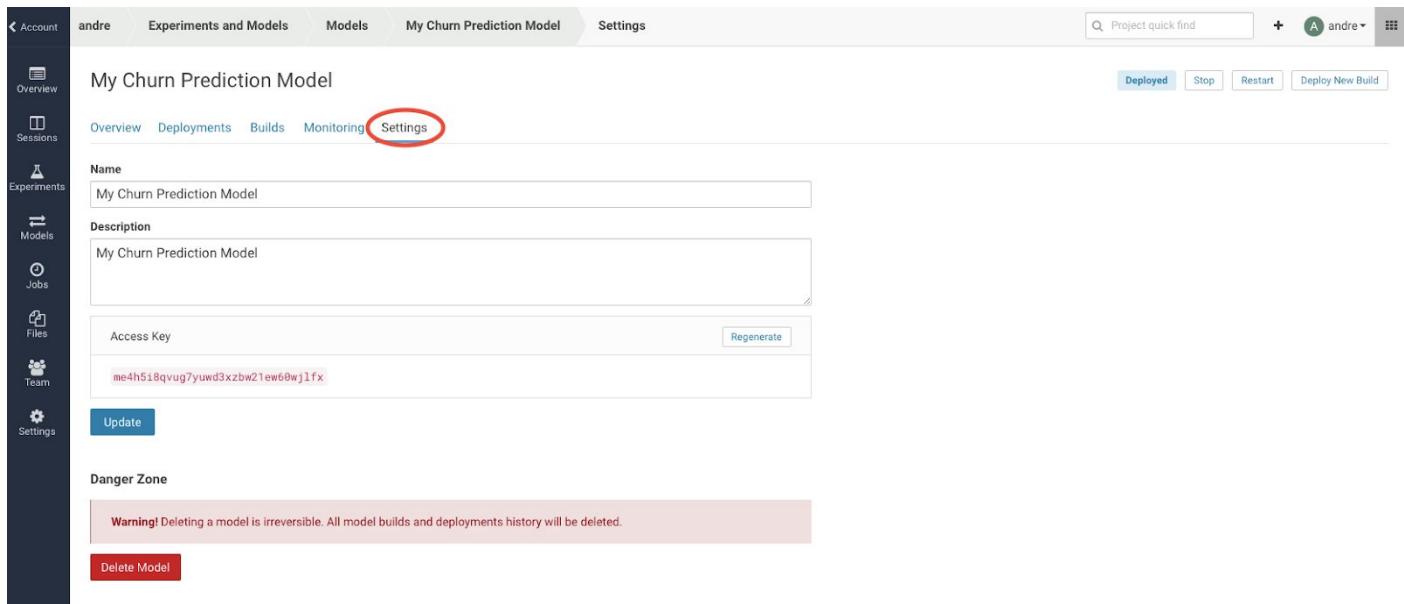

```
2018-10-12 09:15:29.861 2018-10-12 07:15:29.861 36 INFO Model.Runtime Finish Model initialization
2018-10-12 09:15:29.124 2018-10-12 07:15:29.124 36 INFO Model.Runtime Start Model initialization
2018-10-12 09:15:29.065 2018-10-12 07:15:29.064 36 INFO Model.Runtime Start Python model runtime in 36
```

Several statistics of the model are displayed, like the number of times the model has been called, have been processed, etc.

Logfile information is also available here. The most recent logs are at the top of the pane (see image). stderr logs are displayed next to a red bar while stdout logs are by a green bar. Note that model logs and statistics are only preserved so long as the individual replica is active. When a replica restarts (for example, in case of bad input) the logs also start with a clean slate.

## Cloudera - Data Science Labs

Now, navigate to the ‘Settings’ tab.

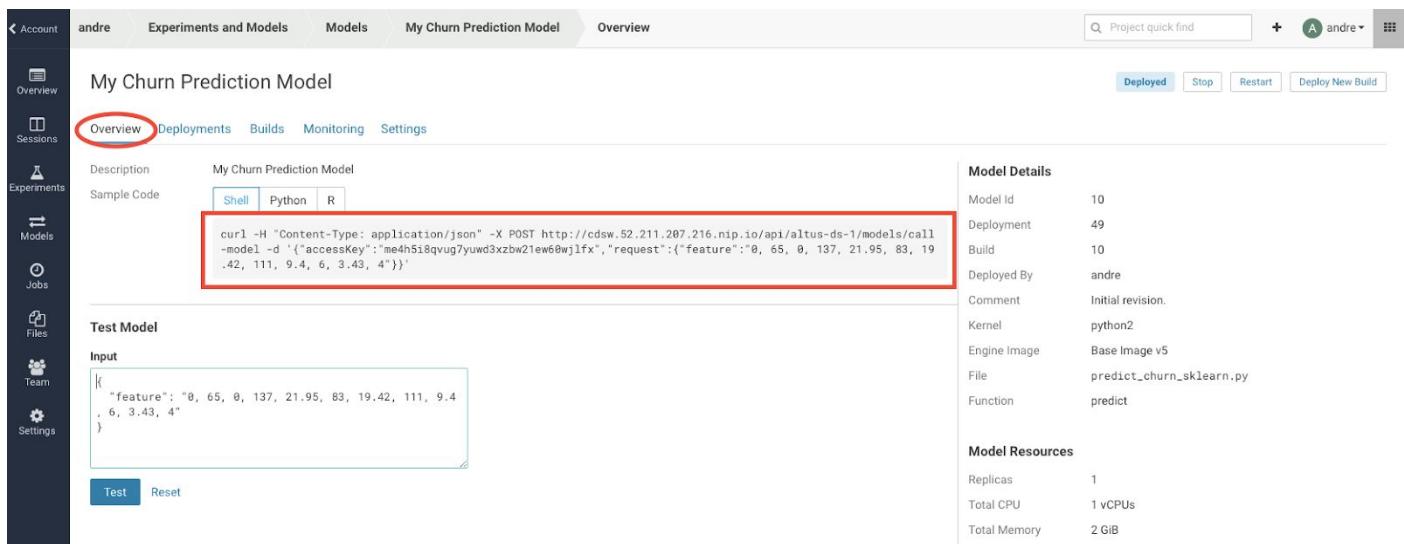

The screenshot shows the 'Settings' tab for a model named 'My Churn Prediction Model'. The 'Access Key' field contains the value 'me4h518qvug7yuwd3xzbw21ew60wj1fx'. A red circle highlights the 'Settings' tab in the navigation bar.

On the settings tab, you will be able to find the “Access Key” that is needed in order to call the model with a REST webservice call.

### Step 5: Test the rest service from a commandline.

The last step in this workshop, is to test the predict function from another (virtual) machine, using the “curl” tool.

Navigate to the Overview tab of your running model.

The screenshot shows the 'Overview' tab for the 'My Churn Prediction Model'. The 'curl' command in the 'Sample Code' section is highlighted with a red box:

```
curl -H "Content-Type: application/json" -X POST http://cdsw.52.211.207.216.nip.io/api/altus-ds-1/models/call -model -d "{\"accessKey\":\"me4h518qvug7yuwd3xzbw21ew60wj1fx\",\"request\":{\"feature\":[0, 65, 0, 137, 21.95, 83, 19.42, 111, 9.4, 6, 3.43, 4]}}"
```

**Model Details**

Model Id	10
Deployment	49
Build	10
Deployed By	andre
Comment	Initial revision.
Kernel	python2
Engine Image	Base Image v5
File	predict_churn_sklearn.py
Function	predict

**Model Resources**

Replicas	1
Total CPU	1 vCPUs
Total Memory	2 GiB

Cloudera - Data Science Labs

Copy the whole shell statement, starting with ‘curl -H ....’

Open a workbench session, running python 2 with 2 GB of memory. When the session is available, open a Terminal.

The screenshot shows the Cloudera Data Science Workbench interface. On the left, there's a sidebar titled "Experiments and Models" containing a list of files: `cdsw-build.sh`, `> data`, `dsfortelco_interactive.py`, `dsfortelco_pyspark.py`, `dsfortelco_pyspark_exp.py`, `dsfortelco_sklearn.py`, `dsfortelco_sklearn_exp.py`, `predict_churn_pyspark.py`, `predict_churn_sklearn.py`, `README.md`, `setup.sh`, `sklearn_rf.pkl`, and `spark-defaults.conf`. The main area has a tab bar with "File", "Edit", "View", "Navigate", "Run", and "predict\_churn\_sklearn.py". A red circle highlights the "Terminal access" button in the top right, which is part of a "Project" dropdown menu. Below it, the terminal window shows a session titled "Untitled Session" connected to "tty-wd\$jang3yfj5znic.cdsw.52.211.207.216.nip.io". The session output includes:

```
1 import pickle
2 import numpy as np
3
4 model = pickle.load(open("models/sklearn_rf.pkl", "rb"))
5
6 def predict(args):
7     account=np.array(args["feature"].split(",")).reshape(1, -1)
8     return {"result": model.predict(account)[0]}
9
10

Welcome to Cloudera Data Science Workbench

## Cloudera - Data Science Labs

The response shows that the model is still running and making predictions.

That completes our lab with models. Please, freeup some resources for other people and new projects. So stop your workbench session. And from the Models page, also stop your deployed model.

The screenshot shows the 'Models' section of the Cloudera Data Science Workbench. On the left sidebar, there are links for 'Overview', 'Sessions', and 'Experiments'. The main area displays a table of models. The first row in the table is highlighted, showing the details for 'My Churn Prediction Model'. The columns in the table are: Model, Status, Replicas, CPU, Memory, Created By, Deployed By, Last Deployed, and Actions. The 'Actions' column for the highlighted row contains a 'Stop' button, which is circled in red. The status of the model is 'Deployed', it has 1 replica, 1 CPU, and 2 GiB memory. It was created and deployed by 'andre' on October 12, 2018, at 9:15 AM.

Model	Status	Replicas	CPU	Memory	Created By	Deployed By	Last Deployed	Actions
My Churn Prediction Model	Deployed	1 / 1	1	2 GiB	andre	andre	Oct 12, 2018, 9:15 AM	<button>Stop</button>

## Cloudera - Data Science Labs

### **Lab 13 – Face recognition with Python: Where is Lego?**

In this lab, you will work with images in Python. Using a predefined library, you will try to locate faces on a photo. And once a face is found, you will try to match a specific face on the photo. The instructions for this lab are less detailed, so you might need to browse back in this document (or use google) to find the exact syntax for some statements.

The instructions for this lab will be using a new library, `face_recognition`.

#### **Step 1:**

Create a new project in CDSW with a Python template, and start a Python 3 workbench with 16GB of RAM

#### **Step 2:**

Install the `face_recognition` library using the “`pip3 install`” command.

As soon as the library is installed, stop your CDSW session. As soon as it is stopped, open a new CDSW session with 4 GB of memory, to allow other students resources to install the library.

Also, install the `opencv-python` library, to use some graphic processing capabilities.

#### **Step 3:**

Open a command prompt from your CDSW workbench, and copy all `.jpg` files from the `hdfs` directory `/tmp/photos` to the home directory of your CDSW session.

To copy files, you can use the command:

```
hdfs dfs -get
```

#### **Step 4:**

Try to display a photo using the `Image` command. Before you can use this command, you need to import some display libraries, with the statement:

```
from IPython.display import Image, display
```

As soon as the library is imported, try to display a photo. Use the command:

```
display(Image('<filename>'))
```

In the directory with `.jpg` files, search for the image with your name. This should be your photo as was found on LinkedIn.

#### **Step 5:**

Detect the exact location of the face on the image, using the `face_recognition` library.

First, load the library:

```
import face_recognition
```

Now you can use the following statement to find where the face is located on the photo:

```
my_photo = face_recognition.load_image_file("<filename>")
my_face_locations = face_recognition.face_locations(my_photo)
```

Check if your algorithm has detected a face, by showing the value.

```
my_face_locations
```

You will see a list of tuples, with the locations of where a face can be found on the photo. Most probably, you will only see 1 tuple, with 1 face on the photo. The output should be something like this:

```
[ (32L, 107L, 94L, 45L) ]
```

## Cloudera - Data Science Labs

This is the representation of 1 tuple, with the values [(top, right, bottom, left)], which represent the pixel in the top right corner, as well as the bottom left corner. The face on the photo is located in the square between these 2 corners.

### **Step 6:**

Cut the face out of the picture. To do this, use the corners found in step 4. First, extract the corners from the array of tuples. You can do this with the following command:

```
top, right, bottom, left = my_face_locations[0]
```

Now we can extract the face out of the photo, using the following statement:

```
from PIL import Image, ImageDraw  
my_face=my_photo[top:bottom, left:right]  
my_face_img=Image.fromarray(my_face)
```

And now visualise the image, to check if it worked.

We use some libraries from PIL for that, so we need to import that first.

```
display(my_face_img)  
You should see the face only now.
```

### **Step 7:**

Use the face\_recognition library to encode the face to a 'match\_code'.

```
my_face_encoding = face_recognition.face_encodings(my_photo) [0]
```

The face encoding is an array of numbers that represent the face from the picture. This array is used for matching to find a face that is similarly looking.

### **Step 8:**

Encode the faces on group photo.

First, show the group photo with the statement:

```
from IPython.display import Image, display  
display(Image(filename="teamphoto.jpg"))
```

Now, find the face locations on the group photo:

```
group_photo = face_recognition.load_image_file("teamphoto.jpg")
```

### **Step 9:**

Write a loop that makes an encoding of each face in the photo, and that matches the face on the group photo with the encoding created in step 6.

A piece of example code is here:

```
group_photo = face_recognition.load_image_file("teamphoto.jpg")
group_face_locations = face_recognition.face_locations(group_photo)
print len(group_face_locations)
for face_location in group_face_locations:
    top, right, bottom, left = face_location
    print top, right, bottom, left
```

Your hints are:

- Find the number of faces in the group photo. Use the statement from Step 4.
- Create a loop to an encoding for each face. Encoding is done using the statement in Step 6.
- Match the encoding of my\_photo and the face of the group\_photo.
- `face_recognition.compare_faces([my_face_encoding], group_face_encoding)`
- If matching is True, then draw a box around the face on the group photo.
- Draw a box statement:
- `import cv2`
- `cv2.rectangle(<image>, (left, top), (right, bottom), (0,0,255), 2)`

If you don't feel like coding, you can also clone the github repository [https://github.com/jmuselaers/face\\_recognition](https://github.com/jmuselaers/face_recognition)
